## I. Safety

Read this manual carefully so that you have a thorough understanding. Installation, commissioning or maintenance may be performed in conjunction with this chapter. EURA will assume no liability or responsibility for any injury or loss caused by improper operation.

### 1.1 Safety information

### 1.1.1 Application Area

The equipment described is intended for industrial motor speed control utilising AC induction motors.

### 1.1.2 Safety definition

Danger: series physical injury or even death may occur if not follow relevant requirements.
Warning: Physical injury or damage to the devices may occur if not follow relevant requirements.
Note: Physical hurt may occur if not follow relevant requirements.
Qualified electricians: People working on the device should take part in professional electrical and safety training, receive the certification and be familiar with all steps and requirements of installing, commissioning, operating and maintaining the device to avoid any emergency.

### 1.1.3 Warning symbols

Warning caution you about conditions which can result in serious injury or death and/or damage to the equipment, and advice on how to avoid the danger. Following warning symbols are used in this manual.

| Symbols | Name | Instruction | Abbreviation |
| :--- | :--- | :--- | :--- |
| A Danger | Electrical <br> danger | Serious physical injury or <br> even may occur if not follow <br> the relative requirements. | Hot |
| Hot sides | Sides of the device may <br> become hot. Do not touch. | Sisi |  |
| Sides | Warnin | Warning | Physical injury or damage to <br> the devices may occur if not <br> follow the relative <br> requirements. | 亿

| Note | Note | Physical hurt may occur if <br> not follow the relative <br> requirements. | Note |
| :--- | :--- | :--- | :--- | :--- |

### 1.1.4 Safety guidelines

### 1.1.5 Delivery and installation

$\left.\left.\begin{array}{|l|l|}\hline \text { away from combustible materials. } \\ \diamond \text { Connect the braking optional parts (braking resistors, braking units or } \\ \text { feedback units) according to the wiring diagram. } \\ \diamond \text { Do not operate on the inverter if there is any damage or components } \\ \text { loss to the inverter. } \\ \diamond \text { Do not touch the inverter with wet items or body, otherwise electric } \\ \text { shock may occur. } \\ \diamond \text { Select appropriate moving and installing tools to ensure a safe and } \\ \text { normal running of the inverter and avoid physical injury or death. For } \\ \text { physical safety, the erector should take some mechanical protective } \\ \text { measurements, such as wearing exposure shoes and working uniforms. } \\ \diamond \text { Ensure to avoid physical shock or vibration during delivery and } \\ \text { installation. } \\ \diamond \text { Do not carry the inverter by its cover to avoid cover falling off. } \\ \diamond \text { Install away from children and other public placers. } \\ \diamond \text { Derating must be considered when the drive is installed at high altitude, } \\ \text { greater than 1000m. This is because the cooling effect of drive is } \\ \text { deteriorated due to the thin air, as shown in Fig1-1 that indicates the } \\ \text { relationship between the elevation and rated current of the drive. } \\ \diamond \text { Forbidden screws, cables and other conductive items to fall inside the }\end{array}\right\} \begin{array}{l}\text { inverter. } \\ \diamond \text { Proper grounding should be ensured with grounding resistance not } \\ \text { exceeding 4 } \Omega \text {; separate grounding is required for motor and inverter. } \\ \text { Grounding with series connection is forbidden. } \\ \diamond \text { R, S and T are the input terminals of the power supply, while U, V and }\end{array}\right\}$

W are the motor terminals. Please connect the input power cables and motor cables with proper techniques; otherwise the damage to the inverter may occur.
$\diamond$ If inverter is installed in a control cabinet, smooth ventilation should be ensured and inverter should be installed vertically (as shown in Fig1-2). If there are several inverters in one cabinet, in order to ensure ventilation, please install inverters side by side. If it is necessary to install several inverters up and down, please add heat-insulation plate (as shown in Fig1-3).

Signal line should not be too long to avoid any increase with common mode interference.
$\checkmark$ Before using the drive, the insulation of the motors must be checked, especially, if it is used for the first time or if it has been stored for a long time. This is to reduce the risk of the drive from being damaged by the poor insulation of the motor.
$\diamond$ Do not connect any varistor or capacitor to the output terminals of the drive, because the drive's output voltage waveform is pulse wave, otherwise tripping or damaging of components may occur; in addition, do not install circuit breaker or contactor at the output side of the drive as shown in Fig 1-4.

Fig 1-1 Derating drive's output current with altitude

## Installing vertically

Fig 1-2 Installing vertically

Fig 1-3 Installed in the cabinet

Fig 1-4 Capacitors are prohibited to be used.

### 1.2 Before using

### 1.2.1 Unpacking inspection

Check as followings after receiving products:

1. Check that there are no damage and humidification to the package. If not, please contact with local agents or company offices.
2. Check the information on the type designation label on the outside of the package to verify that the drive is of the correct type. If not, please contact with local dealers or company offices.
3. Check that there are no signs of water in the package and no signs of damage or breach to the inverter. If not, please contact with local dealers or company offices.
4. Check the information on the type designation label on the outside of the package to verify that the nameplate is of the correct type. If not, please contact with local dealers or company offices.
5. Check to ensure the accessories (including user manual, control keypad and extension card) inside the device is complete. If not, please contact with local dealers or company offices.

### 1.2.2 Application confirmation

! $\triangle$ Check the machine before beginning to use the inverter:

1. Check the load type to verify that there is no overload of the inverter during work and check that whether the drive needs to modify the power degree.
2. Check that the actual current of the motor is less than the rated current of the

| inverter. |
| :--- |
| 3. Check that the control accuracy of the load is the same of the inverter. |
| 4. Check that the incoming supply voltage is correspondent to the rated voltage of |
| the inverter. |
| 5. Check that the communication needs option card or not. |

### 1.2.3 Environment

Check as followings before the actual installation and usage:

1. Check that the ambient temperature of the inverter is below $50^{\circ} \mathrm{C}$. If exceeds, derate $3 \%$ for every additional $1^{\circ} \mathrm{C}$. Additionally, the inverter can not be used if the ambient temperature is above $60^{\circ} \mathrm{C}$.

Note: for the cabinet inverter, the ambient temperature means the air temperature inside the cabinet.
2. Check that the ambient temperature of the inverter in actual usage is above $-10^{\circ} \mathrm{C}$. If not, add heating facilities.
Note: for the cabinet inverter, the ambient temperature means the air temperature inside the cabinet.
3. Check that the altitude of the actual usage site is below 1000 m . If exceeds, derate $1 \%$ for every additional 100 m .
4. Check that the humidity of the actual usage site is below $90 \%$ and condensation is not allowed. If not, add additional protection inverters.
5. Check that the actual usage site is away from direct sunlight and foreign objects cannot enter the inverter. If not, add additional protective measures.
6. Check that there is no conductive dust or flammable gas in the actual usage site. If not, add additional protection to inverters.

### 1.2.4 Installation confirmation

©
Check as followings after the installation:

1. Check that the load range of the input and output cables meet the need of actual load.
2. Check that the accessories of the inverter are correctly and properly installed. The installation cables should meet the needs of every component (including input chokes, input filters, output chokes, output filters, DC choke, braking unit and braking resistor.)
3. Check that the inverter is installed on non-flammable materials and the calorific accessories (chokes and braking resistors) are away from flammable materials.
4. Check that all control cables and power cables are run separately and the rotation complies with EMC requirement.
5. Check that all grounding systems are properly grounded according to the requirements of the inverters.
6. Check that the free space during installation is sufficient according to the instructions in user manual.
7. Check that the installation conforms to the instructions in user manual. The drive must be installed in a vertical position.
8. Check that the external connection terminals are tightly fastened and the torque is appropriate.
9. Check that there are no screws, cables and other conductive items left in the inverter. If not, get them out.

### 1.2.5 Basic commission

Complete the basic commissioning as followings before actual utilization:

1. Select the motor type, set correct motor parameters and select control mode of the inverter according to the actual motor parameters.
2. Auto-tune. If possible, disconnected from the motor load to start dynamic auto-tune. Or if not, static auto-tune is available.
3. Adjust acceleration/deceleration time according to actual running of load.
4. Commission the device via jogging and check that the rotation direction is as required. If not, change the rotation direction by changing the wiring of motor.
5. Set all control parameters and then operate.

### 1.3 Designed Standards for Implementation

- IEC/EN 61800-5-1: 2007 Adjustable speed electrical power drive systems safety requirements.
- IEC/EN 61800-3: 2004/ +A1: 2012 Adjustable speed electrical power drive systems-Part 3: EMC product standard including specific test methods.

## II. Product

This manual offers a brief introduction of the installation connection for E2000 series inverters, parameters setting and operations, and should therefore be properly kept. Please contact manufacturer or dealer in case of any malfunction during application.

### 2.1 Product model naming rule

### 2.2 Function naming rule

## Remarks:

1. Filter for 45 kw and below 45 kw includes R3 and R5. R3 is EMC C3 level standard (testing condition is 25 m motor cable). R5 is EMC C3 level standard (testing condition is 10 m unshielded motor cable). R5 is standard, R3 is optional. 55 kw and above 55 kw meet the need of EMC C3 level standard.
2. For 3-phase 400 V 30 kw and below 30 kW , braking unit is standard.

For $1-$ phase 230 V and 3 -phase $37 \mathrm{~kW}-110 \mathrm{~kW}$, braking unit is built-in and optional. For 3-phase $230 \mathrm{~V}, 1.5 \mathrm{~kW}$ and below $1.5 \mathrm{~kW}, 4.0 \mathrm{~kW} \sim 11 \mathrm{~kW}$, braking unit is standard. For 132 kW and above 132 kW , there is no built-in braking unit.
3. Local keypad :

### 2.4 Product appearance

### 2.4.1 Appearance

The external structure of E2000 series inverter is classified into plastic and metal housings. Wall hanging type and cabinet type are adopted. Good poly-carbon materials are adopted through die-stamping for plastic housing with nice form, good strength and toughness.
Taking E2000-0007S2 for instance, the external appearance and structure are shown as in below Fig.

Metal housing uses advanced exterior plastic- spraying and powder-spraying process on the surface with elegant color and with detachable one-side door hinge structure adopted for front cover, convenient for wiring and maintenance. Taking E2000-0300T3 for instance, its appearance and structure are shown as in right Fig.

2.4.2 Interface
(1) E1 structure

(2) E2-E6 structure

(3) E7 and Metal structure

Table 2-1 E2000 interface introduction

| Structure <br> No. | Contents |  |  |
| :---: | :---: | :---: | :---: |
|  | E1 structure | E2~E6 structure | E7 and metal structure |
| 1 | 8 -core net cable remote keypad interface | Bus communication interface | 8 -core net cable remote keypad interface |

### 2.5 Technical Specifications

## Table2-2 Technical Specifications for E2000 Series Inverters

|  | Items | Contents |
| :---: | :---: | :---: |
| Input | Rated Voltage Range | 3-phase $380-480 \mathrm{~V}(+10 \%,-15 \%){ }^{\text {note } 1}$ <br> 3-phase $220 \mathrm{~V} \sim 240 \mathrm{~V} \pm 15 \%$ <br> 1 -phase $220-240 \mathrm{~V} \pm 15 \%$ |
|  | Rated Frequency | $50 / 60 \mathrm{~Hz}$ |
| Output | Rated Voltage Range | 3-phase 0-INPUT (V) |
|  | Frequency Range | $0.50 \sim 590.0 \mathrm{~Hz}$ (In SVC control mode, the max frequency should be lower than 500 Hz .) |
| Control <br> Mode | Carrier Frequency | $800-16000 \mathrm{~Hz}$, Fixed carrier-wave and random carrier-wave can be selected by F159. |
|  | Input Frequency Resolution | Digital setting: 0.01 Hz , analog setting: max frequency X $0.1 \%$ |
|  | Control Mode | For induction motor: <br> SVC (open-loop vector control) control, V/F control, VC (Closed-loop vector control) control <br> For PMSM: SVC (open-loop vector control) control |
|  | Start Torque | $\begin{aligned} & 0.5 \mathrm{~Hz} / 150 \% \text { (SVC), } 0 \mathrm{~Hz} / 180 \%(\mathrm{VC}), \\ & 5 \% \text { of rated speed } / 100 \% \text { of rated torque (PMSM SVC) } \end{aligned}$ |
|  | Speed-control Scope | 1:100 (SVC), 1:1000 (VC), 1:20 (in PMSM SVC) |
|  | Steady Speed Precision | $\pm 0.5 \%$ (SVC) , $\pm 0.02 \%$ (VC) |
|  | Torque Control Precision | $\pm 5 \%$ |
|  | Overload Capacity | 150\% rated current, 60 seconds. |
|  | Torque Elevating | Auto torque promotion, Manual Torque Promotion includes 1-20 curves. |

Note 1: under different voltage level, user should connect jumper on the pin board, the model of pin board is E2F3UZ00.

## 1) When input voltage is $\mathbf{3 8 0} \sim 420 \mathrm{VAC}$, please connect CN 2 to CN 3 ( 380 V Jumper). <br> 2) When input voltage is $\mathbf{4 2 0} \sim 480 \mathrm{VAC}$, please connect CN4 to CN5 (480V Jumper).

The default system is $\mathbf{3 8 0} \mathbf{\sim 4 2 0 V A C}$, if some operation is needed, please power off inverter and contact with profession
engineer.

### 2.6 Options

| Name | Model | Function | Remarks |
| :---: | :---: | :---: | :---: |
| Differential input PG card | EPG01 | Card with Frequency-division output differential rotary encoder port. (Built-in) | 5 V power and differential output encoder are suitable. Please refer to Appendix 7. |
|  | EPG03 | Card with Frequency-division output differential rotary encoder port. (external) | Refer to user manual of expansion card. |
| Non-differential input PG card | EPG02 | Card with frequency-division output non-differential rotary encoder port. (Built-in) | 15 V power and push-pull or open-collector output encoder are suitable. Please refer to Appendix 7. |
|  | EPG04 | Card with frequency-division output non-differential rotary encoder port. (external) | Refer to user manual of expansion card. |
| I/O expansion card $2+$ differential input PG card | EPGDR01 | 4 terminals of digital input, and 2 terminals of relay output. <br> Card with Frequency-division output differential rotary encoder port. (Built-in) | Refer to user manual of expansion card. |
|  | EPGDR03 | 4 terminals of digital input, and 2 terminals of relay output. <br> Card with Frequency-division output differential rotary encoder port. (Built-in) |  |
| I/O expansion card $2+$ non-differential input PG card | EPGDR02 | 4 terminals of digital input, and 2 terminals of relay output. <br> Card with Frequency-division output non-differential rotary encoder port. (Built-in) |  |

|  | EPGDR04 | 4 terminals of digital input, and 2 terminals of relay output. Card with Frequency-division output non-differential rotary encoder port. (external) |  |
| :---: | :---: | :---: | :---: |
| Input/output expansion card 2 | EDR02 | 4 terminals of digital input, and 2 terminals of relay output. (Built-in) | Refer to FF00~FF09. |
|  | EDR04 | 4 terminals of digital input, and 2 terminals of relay output. (external) | Refer to user manual of expansion card. |
| Detection temperature expansion card | ECPT01 | Detecting motor temperature, which supports sensor type PT100 and PI1000. |  |
| EtherCAT | EIB-ESSI01 | EtherCAT communication (built-in) | Please refer to bus appendix 10. |
|  | EIB-ESSE01 | EtherCAT communication (external) |  |
| CANopen | EIB-CSSI01 | CANopen communication (built-in) |  |
|  | EIB-CSSE01 | CANopen communication (external) |  |
| Profibus | EIB-PDSSI01 | Profibus-DP communication (built-in) |  |
|  | EIB-PDSSE01 | Profibus-DP communication (external) |  |
| BACnet | EIB-BSSI01 | BACnet communication (built-in) | Refer to the user manual of BACnet ${ }^{\text {note }}$ |
|  | EIB-BSSE01 | BACnet communication (external) |  |
| Master/slave control expansion card | EMSC01 | Master/slave control. | This card is needed when three or more inverters are connected together. Please refer to appendix 8. |

## Note:

1. BACnet card is only external now.
2. The structures of some frequency inverters with BACnet card change to E2. The models are as below:

| Model | Power | Structure |
| :---: | :---: | :---: |
| E2000-0004S2 | 0.4 | E2 |
| E2000-0007S2 | 0.75 | E2 |
| E2000-0015S2 | 1.5 | E2 |
| E2000-0002T2 | 0.2 | E2 |
| E2000-0004T2 | 0.4 | E2 |
| E2000-0007T2 | 0.75 | E2 |
| E2000-0015T2 | 1.5 | E2 |
| E2000-0007T3 | 0.75 | E2 |

## III.Keypad panel

Two kinds of controllers (four lines of LCD and LED segment display) are available for E2000 series inverters. Refer to note for Fig3-1.

### 3.1 Panel Illustration

### 3.1.1 LED keypad

The panel covers three sections: data display section, status indicating section and keypad operating section, as shown in Fig. 3-1.

Fig.3-1 Operation Panels

### 3.1.2 LED remote keypad

The panel covers three sections: data display section, status indicating section and keypad operating section, as shown in Fig. 3-2.

Fig.3-2 Operation Panels

### 3.1.3 Four lines of LCD keypad

The panel covers three sections: data display section, status indicating section and keypad operating section,

Fig.3-3 Operation Panels

## Instructions for operation panel:

1. Operation panels of 30 kW and below 30 kW cannot be pulled out. Please select AA-A or A6-1-A control panel to realize remote control, which is connected by 8 -core telephone cable.
2. Operation panels of 30 kW and above 37 kW can be pulled out. Please select A6-1-A control panel to realize remote control, which is connected by 8 core net cable.
3. A9 is four lines of LCD keypad, which is not standard configuration.

### 3.2 Panel structure

1. structure diagram

2. Structure size (Unit: mm)

| Code | A | B | C | D | H | Opening size |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| AA | 76 | 52 | 72 | 48 | 24 | $73 * 49$ |
| A6-1 | 124 | 74 | 120 | 70 | 26 | $121^{* 71}$ |
| A9 | 124 | 74 | 120 | 70 | 24 | $121^{*} 71$ |

3. Panel mounting structure diagram

4. Panel mounting size (Unit: mm)

| Code | Keypad panel size |  | Opening size |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | E | F | L | $\underline{\mathrm{N}}$ | M |
| AA | 109 | 80 | 20 | 75 | 81 |
| A6-1 | 170 | 110 | 22 | 102 | 142 |
| A9 | 170 | 110 | 22 | 102 | 142 |

5. Port of control panel

Note: The interface of control board should be completely consistent with the interface of the keypad panel,
so the line sequence should also be the same.
6. The default remote-control wire length is 1 m . The length of remote-control wire can be custom-made by users. If on the occasion of strong interference or the length is longer than 3 m , please put a magnetic ring on the wire to avoid interference.

### 3.3 Panel Operating

All keys on the panel are available for user. Refer to Table 3-3 for their functions.
Table 3-3
Uses of Keys

| Keys | Names | Remarks |
| :---: | :---: | :--- |
| Fun | Fun | To call function code and switch over display mode. |
| Set | Set | To call and save data. |
| $\boldsymbol{A}$ | Up | To increase data (speed control or setting parameters) |
| $\boldsymbol{\nabla}$ | Down | To decrease data (speed control or setting parameters) |
| Run | Run | To start inverter; |
| Stoprest | Stop or reset | To stop inverter; to reset in fault status; to change function codes in a code <br> group or between two code groups. |
|  | Multi-function <br> key | FWD/REV jogging and LOC/REM control is selected by multi-function <br> key. |
|  | Forward or <br> reverse | Switchover of motor forward/reverse running |
| $\ll$ | Shift key | Shift and displaying items switchover. |

## Operating structure of four-line LCD:

The display interface of keypad will turn to malfunction interface when inverter trips into fault. User can check current, voltage and frequency by pressing ${ }^{*}$. The specific values will be displayed on the fourth line of malfunction interface if the malfunction code is displayed as anyone of OC, OC1, OE, OL1 and OL2. "?A", "?V" and "?Hz" for current, voltage and frequency respectively will be displayed if malfunction code is not one of above 6 malfunctions. User can check malfunction type and status of second (third) -to-last by pressing $\lll$. After clearing the faults, keypad cannot response reset function but only shift function when pressing Reset/Stop key in non-malfunction interface; keypad can response reset function when pressing Reset/Stop key only in malfunction interface.

### 3.4 Parameters Setting

This inverter has numerous function parameters, which the user can modify to effect different modes of operation control. User needs to realize that if user sets password valid (F107=1), user's password must be
entered first if parameters are to be set after power off or protection is effected, i.e., to call F100 as per the mode in Table 2-2 and enter the correct code. User's password is invalid before delivery, and user could set corresponding parameters without entering password.

## Table 3-2 Steps for Parameters Setting

| Steps | Keys | Operation | Display |
| :---: | :---: | :---: | :---: |
| 1 | Fun | Press "Fun" key to display function code | FIDI |
| 2 | $\triangle$ or $\nabla$ | Press "Up" or"Down" to select required function code | FH4 |
| 3 | Set | To read data set in the function code | 5.11 |
| 4 | $\triangle$ or V | To modify data | 9.1 |
| 5 | Set | To display corresponding function code after saving the set data | FIOT |
|  | Fun | To display the current function code | \%mim |

The above-mentioned step should be operated when inverter is in stop status.

### 3.5 Function Codes Switchover in/between Code-Groups

It has more than 300 parameters (function codes) available to user, divided into 10 sections as indicated in Table 3-3.

Table 3-3
Function Code Partition

| Group Name | Function <br> Code Range | Group Name | Function <br> Code Range |
| :--- | :---: | :--- | :---: |
| Basic Parameters | F1 | Parameters of the motor | F8 |
| Run Control Mode | F2 | Communication function | F9 |
| Multi-functional <br> input/output terminal | F3 | PID parameter setting | FA |
| Analog signals and pulse of <br> input/output | F4 | Torque control | FC |
| Multi-stage speed <br> parameters | F5 | The second motor <br> parameters | FE |
| Subsidiary function | F6 | IO expansion | FF |
| Timing control and protection <br> function | F7 | Parameters display | H0 |

As parameters setting costs time due to numerous function codes, such function is specially designed as "Function Code Switchover in a Code Group or between Two Code-Groups" so that parameters setting become convenient and simple.

Press "Fun" key so that the keypad controller will display function code. If press " $\boldsymbol{\Delta}$ " or " $\boldsymbol{\nabla}$ " key then, function code will circularly keep increasing or decreasing by degrees within the group; if press the "stop/reset" key again, function code will change circularly between two code groups when operating the " $\boldsymbol{\Delta}$ " or " $\boldsymbol{\nabla}$ " key.
e.g. when function code shows F111 and DGT indicator is on, press " $\boldsymbol{\Delta}$ "/ " $\boldsymbol{\nabla}$ " key, function code will keep increasing or decreasing by degrees within F100~F160; press "stop/reset" key again, DGT indicator will be off. When pressing " $\boldsymbol{\Delta}$ "/ " $\boldsymbol{\nabla}$ " key, function codes will change circularly among the 10 code-groups, like F211, F311...FA11, F111..., Refer to Fig 2-2 (The sparkling "S엉ㅇ ${ }^{38}$ is indicated the corresponding target frequency values).

Fig 3-6 Switchoverina CodeGrouporbetweenDifferentCode-Groups

### 3.6 Panel Display

Table 3-4
Items and Remarks Displayed on the Panel

| Items | Remarks |
| :--- | :--- |
| Power on.... <br> (Four-line LCD) | It stands for power on process. |
| HF-0 | This Item will be displayed when you press "Fun" in stopping status, which indicates jogging <br> operation is valid. But HF-0 will be displayed only after you change the value of F132. |
| -HF- | It stands for resetting process and will display target frequency after reset. |
| OC, OC1, OC2, OE, <br> OL1, OL2, OH, LU, | Fault code, indicating "over-current OC", "over-current OC1", "over-current OC2", <br> "over-voltage", "inverter over-load", "motor over-load" "over-heat", "under-voltage <br> PF0, PF1,CE, PG, <br> for input", "phase loss for output", "phase loss for input","communication error ", <br> PG disconnection protection, STO and STO1 respectively. |
| AErr, EP, nP, Err5 | Analog line disconnected, inverter under-load, pressure control, PID parameters are <br> set wrong, |
| ovEr, br1, br2 | (textile industry) yarn full, yarn broken, yarn intertwining. |
| ESP | During two-line/three line running mode, "stop/reset" key is pressed or external <br> emergency stop terminal is closed, ESP will be displayed. |

| oPEn | When oPEn terminal is invalid, inverter will trip into oPEn protection. |
| :--- | :--- |
| F152 | Function code (parameter code). |
| 10.00 | Indicating inverter's current running frequency (or rotate speed) and parameter <br> setting values, etc. |
| 50.00 | Sparkling in stopping status to display target frequency. |
| A100, U100, u540 | Output current (100A) and output voltage (100V) and bus voltage(540V). |
| $\mathrm{b}^{* * *}$ | PID feedback value is displayed. |
| $\mathrm{o}^{* *}$. | PID given value is displayed. |
| $\mathrm{L}^{* * *}$ | Linear speed is displayed. |
| H H** | Radiator temperature is displayed. |

## IV. Installation \& Connection

### 4.1 Installation

Inverter should be installed vertically, as shown in Fig $4-1$. Sufficient ventilation space should be ensured in its surrounding.

Fig 4-1 Installation Sketch

Table 4-1 Clearance Dimensions

| Model | Clearance Dimensions |  |
| :---: | :---: | :---: |
| Hanging $(<55 \mathrm{~kW})$ | $\mathrm{A} \geq 150 \mathrm{~mm}$ | $\mathrm{~B} \geq 100 \mathrm{~mm}$ |
| Hanging $(\geq 55 \mathrm{~kW})$ | $\mathrm{A} \geq 200 \mathrm{~mm}$ | $\mathrm{~B} \geq 100 \mathrm{~mm}$ |
| Cabinet $(110 \sim 800 \mathrm{~kW})$ | $\mathrm{C} \geq 200 \mathrm{~mm}$ | $\mathrm{D} \geq 100 \mathrm{~mm}$ |

### 4.2 Connection

- In case of 3-phase input, connect R/L1, S/L2 and T/L3 terminals (L1/R and L2/S terminals for single-phase) with power source from network and $力 /$ PE/E to earthing, $\mathrm{U}, \mathrm{V}$ and W terminals to motor.
- Motor shall have to be ground connected. Or else electrified motor causes interference.

Power terminals sketch of inverter with 1-phase 230 V 1.5 kW and below 1.5 kW .

Power terminals sketch of inverter with 3-phase 230 V 1.5 kW and below 1.5 kW .

Power terminals sketch of inverter with 1-phase 230 V 2.2 kW , 3-phase $230 \mathrm{~V} 2.2 \mathrm{~kW} \sim 5.5 \mathrm{~kW}$, and 3 -phase $400 \mathrm{~V} 0.75 \mathrm{~kW} \sim 15 \mathrm{~kW}$.

Power terminals sketch of inverter with 3-phase $230 \mathrm{~V} 7.5 \sim 11 \mathrm{~kW}$ and three-phase 400 V $18.5 \mathrm{~kW} \sim 45 \mathrm{~kW}$.

Power terminals sketch of inverter with 3-phase $230 \mathrm{~V} 15 \sim 75 \mathrm{~kW}$ and 3-phase $400 \mathrm{~V} 55 \mathrm{~kW} \sim 185 \mathrm{~kW}$ hanging type inverter and $110 \mathrm{kw} \sim 160 \mathrm{kw}$ cabinet inverter.

Power terminals sketch of inverter with 3-phase 200kw~400kw hanging type inverter and $185 \mathrm{kw} \sim 800 \mathrm{kw}$ cabinet inverter.

(The figure is only sketch, terminals order of practical products may be different from the above-mentioned figure.)

Introduction of terminals of power loop

| Terminals | Terminal Marking | Terminal Function Description |
| :---: | :---: | :---: |
| Power Input Terminal | $\begin{gathered} \mathrm{L} 1 / \mathrm{R}, \mathrm{~L} 2 / \mathrm{S}, \\ \mathrm{~L} 3 / \mathrm{T} \\ \hline \end{gathered}$ | Input terminals of three-phase 400 V AC voltage (L1/R and L2/S terminals for 1-phase) |
| Output Terminal | U, V, W | Inverter power output terminal, connected to motor. |
| Grounding Terminal | $\mathrm{PE} / \mathrm{E} / \oplus$ | Inverter grounding terminal. |
| Rest Terminal | P/+, B/BR | External braking resistor. |
|  | P/+, N/- | DC bus-line output |
|  |  | Externally connected to braking unit <br> $\mathrm{P} /+$ connected to input terminal " P " or " $\mathrm{DC}+$ "of braking unit, <br> $\mathrm{N} /$ - connected to input terminal of braking unit " N " or "DC-". |

### 4.3 Functions of control terminals

The key to operate the inverter is to operate the control terminals correctly and flexibly. Certainly, the control terminals are not operated separately, and they should match corresponding settings of parameters. This chapter describes basic functions of the control terminals. The users may operate the control terminals by combining relevant contents hereafter about "Defined Functions of the Terminals".

## Wiring for control loop as follows:

| TA | TB | TC | DO1 | DO2 | 24V | CM | DI1 | DI2 | DI3 | DI4 | DI5 | DI6 | DI7 | DI8 | 10V | AI1 | AI2 | GND | AO1 | AO2 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| GND | 5V | A+ | B- | H | L | GND |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Table 4-3

| Terminal | Type | Description | Function |  |
| :---: | :---: | :---: | :---: | :---: |
| DO1 | Output signal | Multifunctional output terminal 1 | When the token function is valid, the value between this terminal and CM is 0 V ; when the inverter is stopped, the value is 24 V . When DO1 is as high-frequency output terminal, the max output frequency is 100 KHz and please do not connect to intermediate relay. | The functions of output terminals shall be defined per manufacturer's value. Their initial state may be changed through changing function codes. |
| DO2 ${ }^{\text {Note } 1}$ |  | Multifunctional output terminal 2 | When the token function is valid, the value between this terminal and CM is 0 V ; when the inverter is stopped, the value is 24 V . |  |
| TA |  | Relay contact | TC is a common point, TB-TC are normally closed contacts, TA-TC are normally open contacts. The contact capacity is $10 \mathrm{~A} / 125 \mathrm{VAC}$, $\mathrm{NO} / \mathrm{NC} 3 \mathrm{~A} 250 \mathrm{VAC} / 30 \mathrm{VDC}$. |  |
| TB |  |  |  |  |
| TC |  |  |  |  |
| AO1 |  | Voltage/current output | It is connected with frequency meter, speedometer or ammeter externally, and its minus pole is connected with GND. See F423~F426 for details,. |  |
| AO2 |  | Current output | It is connected with ammeter externally, and its minus pole is connected with GND. See F427~F430 for details |  |
| 10 V | Analog power supply | Self contained power supply | Internal 10 V self-contained power supply of the to the inverter. When used externally, it can supply for voltage control signal, with current | he inverter provides power only be used as the power estricted below 20 mA . |
| AI1 ${ }^{\text {Note } 2}$ | Input <br> Signal | Voltage analog input port | When analog speed control is adopted, the voltage or current signal is input through this terminal. The range of voltage input is $0 \sim 5 \mathrm{~V}$ or $0 \sim 10 \mathrm{~V}$ or $-10 \mathrm{~V}-10 \mathrm{~V}$, and the current input is $0 \sim 20 \mathrm{~mA}$, the input resistor is 500 Ohm , and grounding: GND. If the input is $4 \sim 20 \mathrm{~mA}$, it can be realized by setting F406=2. The voltage or current signal can be chosen by coding switch. See table 5-2, 5-3 for details, and F438 and F439 also should be set accordingly. The default setting of AI1 is $0 \sim 10 \mathrm{~V}$, and the default setting of AI2 is $0 \sim 20 \mathrm{~mA}$. |  |
| AI2 |  | Voltage / Current analog input port |  |  |  |
| GND |  | Self-contained Power supply Ground | Ground terminal of external control signal (voltage control signal or current source control signal) is also the ground of 10 V power supply of this inverter. |  |

| 24 V | Power supply | Control power supply | Power: $24 \pm 1.5 \mathrm{~V}$, grounding is CM ; current is r external use. | restricted below 200 mA for |
| :---: | :---: | :---: | :---: | :---: |
| DI1 | Digital input control terminal | Jogging terminal | When this terminal is valid, the inverter will have jogging running. The jogging function of this terminal is valid under both at stopped and running status. This terminal can also be used as high-speed pulse input port. The max frequency is 100 KHz . | The functions of input terminals shall be defined per manufacturer's value. Other functions can also be defined by changing function codes. |
| DI2 |  | External <br> Emergency Stop | When this terminal is valid, "ESP" malfunction signal will be displayed. |  |
| DI3 |  | "FWD" Terminal | When this terminal is valid, inverter will run forward. |  |
| DI4 |  | "REV" Terminal | When this terminal is valid, inverter will run reversely. |  |
| DI5 |  | Reset terminal | Make this terminal valid under fault status to reset the inverter. |  |
| DI6 |  | Free-stop | Make this terminal valid during running can realize free stop. |  |
| DI7 ${ }^{\text {Note } 1}$ |  | Running terminal | When this terminal is in the valid state, inverter will run by the acceleration time. |  |
| DI8 ${ }^{\text {Note } 1}$ |  | Stop terminal | Make this terminal valid during running can realize stop by the deceleration time. |  |
| CM | $\begin{gathered} \text { Common } \\ \text { port } \end{gathered}$ | Grounding of control power supply | The grounding of 24 V power supply and other | ontrol signals. |
| GND | 485 <br> communi cation terminals | Grounding of differential signal | Grounding of differential signal |  |
| 5 V |  | Power of differential signal | Power of differential signal |  |
| A+ |  | Positive polarity of differential signal | Standard: TIA/EIA-485(RS-485) <br> Communication protocol: Modbus Communication rate: 1200/2400/4800/9600/19200/38400/57600bps |  |
| B- |  | Negative polarity of Differential signal |  |  |  |
| GND |  | CAN cable shielded layer | CAN cable's shielded layber |  |
| H |  | CAN H high-level cable | Can baud rate: 20/50/100/125/250/500/1000kbps |  |
| L |  | CAN L low-level cable |  |  |  |

## Note:

1. T3 30 kW and below 30 kW and T2 11 kw and below 11 kw inverters have no DO2, DI7 and DI8 control terminals.
2. AI1 terminal of T3 30 kW and below 30 kW and T 211 kw and below 11 kw inverters can only accept
voltage signal, the default voltage is $0 \sim 10 \mathrm{~V}$.
3. CAN communication terminal is available from frame size E2. E2-E6 has H and L terminals, E7 and above has GND/H/L terminals. GND terminal must be connected between inverters. Communication cable must be shielded twisted cable. J11 of inverters on the head end and terminal end of bus turns to ON. J11 of the other inverters turn to OFF.

## Toggle Switch J11

## Wiring for digital input terminals:

Generally, shield cable is adopted and wiring distance should be as short as possible. When active signal is adopted, it is necessary to take filter measures to prevent power supply interference. Mode of contact control is recommended.
Digital input terminals are only connected by source electrode (NPN mode) or by drain electrode (PNP mode). If NPN mode is adopted, please turn the toggle switch to the end of "NPN".
Wiring for control terminals as follows:

## 1. Wiring for positive source electrode (NPN mode).

## 2. Wiring for active source electrode

If digital input control terminals are connected by drain electrode, please turn the toggle switch to the end of "PNP". Wiring for control terminals as follows:
3. Wiring for positive drain electrode (PNP mode)

4. Wiring for active drain electrode (PNP mode)

Wiring by source electrode is a mode most in use at present. Wiring for control terminal is connected by source electrode, user should choose wiring mode according to requirement.
Instructions of choosing NPN mode or PNP mode:

1. There is a toggle switch J7 near to control terminals. Please refer tc Fig 3-2.
2. When turning J 7 to "NPN", DI terminal is connected to CM.

When turning J7 to "PNP", DI terminal is connected to 24 V .

NPN

PNP

Fig 4-2 Toggle Switch J7

### 4.4 Measurement of main circuit voltages, currents and powers

Since the voltages and currents on the inverter power supply and output sides include harmonics, measurement data depends on the instruments used and circuits measured. When instruments for commercial frequency are used for measurement, measure the following circuits with the recommended instruments.

Examples of Measuring Points and Instruments

| Item | Measuring Point | Measuring Instrument | Remarks (Reference Measurement Value) |
| :---: | :---: | :---: | :---: |
| Power supply voltage V1 | Across R-S,S-T, T-R | Moving-iron type AC voltmeter | $400 \mathrm{~V} \pm 15 \%, 230 \mathrm{~V} \pm 15 \%$ |
| Power supply side current I1 | R, S, and T line currents | Moving-iron type AC voltmeter |  |
| Power supply side power P1 | At R, S and T, and across R-S, S-T and T-R | Electrodynamic type single-phase wattmeter | $\begin{aligned} & \mathrm{P} 1=\mathrm{W} 11+\mathrm{W} 12+\mathrm{W} 13 \\ & \text { (3-wattmeter method) } \end{aligned}$ |
| Power supply side power factor Pfl | Calculate after measuring power supply voltage, power supply side current and power supply side power.[Three phase power supply]$P f 1=\frac{P 1}{\sqrt{3} V 1 \times I 1} \times 100 \%$ |  |  |
| Output side voltage V2 | Across U-V, V-W and W-U | Rectifier type AC voltmeter (Moving-iron type cannot measure) | Difference between the phases is within $\pm 1 \%$ of the maximum output voltage. |
| $\begin{array}{lc} \text { Output } & \text { side } \\ \text { current I2 } \end{array}$ | $\mathrm{U}, \mathrm{V}$ and W line currents | Moving-iron type AC Ammeter | Current should be equal to or less than rated inverter current. <br> Difference between the phases is $10 \%$ or lower of the rated inverter current. |
| Output side power P2 | U, V, W and U-V, V-W,W-U | Electrodynamic type single-phase wattmeter | $\mathrm{P} 2=\mathrm{W} 21+\mathrm{W} 22$ <br> 2-wattmeter method |
| Output side power factor Pf2 | Calculate in similar manner to power supply side power factor:$P f 2=\frac{P 2}{\sqrt{3} V 2 \times I 2} \times 100 \%$ |  |  |
| Converter output | Across $\mathrm{P}+$ ( P ) and -( N ) | Moving-coil type (such as multi-meter) | $\begin{aligned} & \text { DC voltage, the value is } \\ & \sqrt{2} \times V 1 \end{aligned}$ |
| Power supply of control PCB | Across 10V-GND | Moving-coil type (such as multi-meter) | DC10V $\pm 0.2 \mathrm{~V}$ |
|  | Across 24V-CM | Moving-coil type (such as multi-meter) | DC24V $\pm 1.5 \mathrm{~V}$ |
| Analog output AO1 | Across AO1-GND | Moving-coil type (such as multi-meter) | Approx. DC10V at max frequency. |
|  | Across AO2-GND | Moving-coil type (such as multi-meter) | Approx. DC $0 \sim 20 \mathrm{~mA}$ at max frequency |
| Alarm signal | Across TA/TC <br> Across TB/TC | Moving-coil type (such as multi-meter) | <Normal> <Abnormal> Across <br> TA/TC: Discontinuity Continuity Across TB/TC: Continuity Discontinuity |

### 4.6 Lead section area of protect conductor (grounding wire)

| Lead section area $\mathbf{S}$ of $\mathbf{U}, \mathbf{V}, \mathbf{W}\left(\mathbf{m m}^{\mathbf{2}}\right)$ | Min lead section area of |
| :---: | :---: |
| $\mathrm{S} \leq 16$ | S |
| $16<\mathrm{S} \leq 35$ | 16 |
| $35<\mathrm{S}$ | $\mathrm{S} / 2$ |

### 4.7 Overall Connection and "Three- Line" Connection

* Refer to next figure for overall connection sketch for E2000 series inverters. Wiring mode is available for various terminals whereas not every terminal needs connection when applied.

Note:

1. Please only connect power terminals $\mathrm{L} 1 / \mathrm{R}$ and $\mathrm{L} 2 / \mathrm{S}$ with power grid for single-phase inverters.
2. 485 communication port has built-in standard MODBUS communication protocol. Communication port is on the left side of inverter. The sequence from top to down is $\mathrm{B}-, \mathrm{A}+, 5 \mathrm{~V}$ power, and GND.
3. Inverter above 30 kW has 8 multifunctional input terminals DI1~DI8, 30kW inverter and below 30 kW has 6 multifunctional input terminals DI1~DI6.
4. The contact capacity is $10 \mathrm{~A} / 125 \mathrm{VAC}$. $\mathrm{NO} / \mathrm{NC}: 3 \mathrm{~A} 250 \mathrm{VAC} / 30 \mathrm{VDC}$.

### 4.8 Basic methods of suppressing the noise

The noise generated by the drive may disturb the equipment nearby. The degree of disturbance is dependent on the drive system, immunity of the equipment, wiring, installation clearance and earthing methods.

### 4.8.1 Noise propagation paths and suppressing methods

(1) Noise categories

(2) Noise propagation paths

(3)Basic methods of suppressing the noise

| Noise emission paths | Actions to reduce the noise |
| :---: | :--- |
| (2) | When the external equipment forms a loop with the drive, the equipment may suffer <br> nuisance tripping due to the drive's earth leakage current. The problem can be solved <br> if the equipment is not grounded. |
| (3) | If the external equipment shares the same AC supply with the drive, the drive's noise may be <br> transmitted along its input power supply cables, which may cause nuisance tripping to other <br> external equipment. Take the following actions to solve this problem: Install noise filter at the <br> input side of the drive, and use an isolation transformer or line filter to prevent the noise from <br> disturbing the external equipment. |
| (4)(5)(6) | If the signal cables of measuring meters, radio equipment and sensors are installed in a cabinet <br> together with the drive, these equipment cables will be easily disturbed. Take the actions below <br> to solve the problem: <br> (1) The equipment and the signal cables should be as far away as possible from the drive. The <br> signal cables should be shielded and the shielding layer should be grounded. The signal cables <br> should be placed inside a metal tube and should be located as far away as possible from the <br> input/output cables of the drive. If the signal cables must cross over the power cables, they <br> should be placed at right angle to one another. <br> (2) Install radio noise filter and linear noise filter (ferrite common-mode choke) at the input and <br> output of the drive to suppress the emission noise of power lines. <br> (3) Motor cables should be placed in a tube thicker than 2mm or buried in a cement conduit. <br> Power cables should be placed inside a metal tube and be grounded by shielding layer |
| (1)(7)(8) | Don't route the signal cables in parallel with the power cables or bundle these cables together <br> because the induced electro-magnetic noise and induced ESD noise may disturb the signal <br> cables. Other equipment should also be located as far away as possible from the drive. The <br> signal cables should be placed inside a metal tube and should be placed as far away as possible <br> from the input/output cables of the drive. The signal cables and power cables should be <br> shielded cables. EMC interference will be further reduced if they could be placed inside metal <br> tubes. The clearance <br> between the metal tubes should be at least 20cm. |

### 4.8.2 Field Wire Connections

Control cables, input power cables and motor cables should be installed separately, and enough clearance should be left among the cables, especially when the cables are laid in parallel and the cable length is big. If the signal cables must go through the power cables, they should be vertical to each other.

Generally, the control cables should be shielded cables and the shielding metal net must be connected to the metal enclosure of the drive by cable clamps.

### 4.8.3 Earthing

Independent earthing poles (best)

Shared earthing pole (good)

Shared earthing cable (not good)

## Note:

1. In order to reduce the earthing resistance, flat cable should be used because the high frequency impedance of flat cable is smaller than that of round cable with the same CSA.
2. If the earthing poles of different equipment in one system are connected together, then the leakage current will be a noise source that may disturb the whole system. Therefore, the drive's earthing pole should be separated with the earthing pole of other equipment such as audio equipment, sensors and PC , etc.
3. Earthing cables should be as far away from the I/O cables of the equipment that is sensitive to noise, and also should be as short as possible.

### 4.8.4 Leakage current

Leakage current may flow through the drive's input and output capacitors and the motor's capacitor. The leakage current value is dependent on the distributed capacitance and carrier wave frequency. The leakage current includes ground leakage current and the leakage current between lines.

Ground leakage current
The ground leakage current can not only flow into the drive system, but also other equipment via earthing cables. It may cause the leakage current circuit breaker and relays falsely activated. The higher the drive's carrier wave frequency, the bigger the leakage current, also, the longer the motor cable, the greater the leakage current,
Suppressing methods:
Reduce the carrier wave frequency, but the motor noise may be louder;
Motor cables should be as short as possible;
The drive and other equipment should use leakage current circuit breaker designed for protecting the product against high-order harmonics/surge leakage current;
Leakage current between lines
The line leakage current flowing through the distribution capacitors of the drive out side may cause the thermal relay falsely activated, especially for the drive whose power is lower than 7.5 kW . When the cable is longer than 50 m , the ratio of leakage current to motor rated current may be increased that can cause the wrong action of external thermal relay very easily.
Suppressing methods:
Reduce the carrier wave frequency, but the motor noise may become louder;
Install reactor at the output side of the drive.
In order to protect the motor reliably, it is recommended to use a temperature sensor to detect the motor's temperature, and use the drive's over-load protection device (electronic thermal relay) instead of an external thermal relay.

### 4.8.5 Electrical installation of the drive

## Note:

-Motor cable should be earthed at the drive side, if possible, the motor and drive should be earthed separately;
$\cdot$ Motor cable and control cable should be shielded. The shield must be earthed and avoid entangling at cable end to improve high frequency noise immunity.
-Assure good conductivity among plates, screw and metal case of the drive; use tooth-shape washer and conductive installation plate;

### 4.8.6 Application of Power Line Filter

Power source filter should be used in the equipment that may generate strong EMI or the equipment that is sensitive to the external EMI. The power source filter should be a two-way low pass filter through which only 50 Hz current can flow and high frequency current should be rejected.
Function of power line filter
The power line filter ensures the equipment can satisfy the conducting emission and conducting sensitivity in EMC standard. It can also suppress the radiation of the equipment.
Common mistakes in using power cable filter

## 1. Too long power cable

The filter inside the cabinet should be located near to the input power source. The length of the power cables should be as short as possible.
2. The input and output cables of the AC supply filter are too close

The distance between input and output cables of the filter should be as far apart as possible, otherwise the high frequency noise may be coupled between the cables and bypass the filter. Thus, the filter will become ineffective.

## 3. Bad earthing of filter

The filter's enclosure must be earthed properly to the metal case of the drive. In order to be earthed well, make use of a special earthing terminal on the filter's enclosure. If you use one cable to connect the filter to the case, the earthing is useless for high frequency interference. When the frequency is high, so is the impedance of cable, hence there is little bypass effect. The filter should be mounted on the enclosure of equipment. Ensure to clear away the insulation paint between the filter case and the enclosure for good earthing contact.

### 4.8.7 Jumper for switching off safety capacitor

The default position of jumper J1 for safety capacitor is ENABLE. If the earth leakage circuit breaker is active during powering on, please change the position of J 1 to DISABLE.
On power PCB, the default position of J 1 is Pin 1 and 3, which is for EMC interference. If the earth leakage circuit breaker is active during powering on, please plug the J 1 with Pin 2 and 4.

## V. Operation and Simple Running

This chapter defines and interprets the terms and nouns describing the control, running and status of the inverter. Please read it carefully. It will be helpful to your correct operation.

### 5.1 Basic conception

### 5.1.1 Control mode

E2000 inverter has five control modes: sensorless vector control ( $\mathrm{F} 106=0$ ), closed-loop vector control (F106=1), V/F control (F106=2) and vector control 1 (F106=3), PMSM vector control (F106=6).

### 5.1.2 Mode of torque compensation

Under V/F control mode, E2000 inverter has five kinds of torque compensation modes: Linear compensation ( $\mathrm{F} 137=0$ ); Square compensation ( $\mathrm{F} 137=1$ ); User-defined multipoint compensation ( $\mathrm{F} 137=2$ ); Auto torque compensation (F137=3); VF separation (F137=4).

### 5.1.3 Mode of frequency setting

Please refer to F203~F207 for the method for setting the running frequency of the E2000 inverter.

### 5.1.4 Mode of controlling for running command

The channel for inverter to receive control commands (including start, stop and jogging, etc) contains three modes: 1. Keypad (keypad panel) control; 2. External terminal control; 3. Communication control.
The modes of control command can be selected through the function codes F200 and F201.

### 5.1.5 Operating status of inverter

When the inverter is powered on, it may have four kinds of operating status: stopped status, programming status, running status, and fault alarm status. They are described in the following:

## Stopped status

If re-energize the inverter (if "auto-startup after being powered on" is not set) or decelerate the inverter to stop, the inverter is at the stopping status until receiving control command. At this moment, the running status indicator on the keypad goes off, and the display shows the display status before power down.

## Programming status

Through keypad panel, the inverter can be switched to the status that can read or change the function code parameters. Such a status is the programming status.
There are numbers of function parameters in the inverter. By changing these parameters, the user can realize different control modes.

## Running status

The inverter at the stopped status or fault-free status will enter running status after having received operation command.
The running indicator on keypad panel lights up under normal running status.

## Fault alarm status

The status under which the inverter has a fault and the fault code is displayed.
Fault codes mainly include: OC, OE, OL1, OL2, OH, LU, PF1 and PF0 representing "over current", "over voltage", "inverter overload", "motor overload", "overheat", "input under-voltage", "input phase loss", and "output phase loss" respectively.
For trouble shooting, please refer to Appendix I to this manual, "Trouble Shooting".

### 5.2 Keypad panel and operation method

Keypad panel (keypad) is a standard part for configuration of E2000 inverter. Through keypad panel, the user may carry out parameter setting, status monitoring and operation control over the inverter. Both keypad panel and display screen are arranged on the keypad controller, which mainly consists of three sections: data display section, status indicating section, and keypad operating section. There are two types of keypad controller (LED and four-line LCD) for inverter. For details, please refer to Chapter II of this manual, "Keypad panel".

It is necessary to know the functions and how to use the keypad panel. Please read this manual carefully before operation.

### 5.2.1 Method of operating the keypad panel

(1) Operation process of setting the parameters through keypad panel

A three-level menu structure is adopted for setting the parameters through keypad panel of inverter, which enables convenient and quick searching and changing of function code parameters.
Three-level menu: Function code group (first-level menu) $\rightarrow$ Function code (second-level menu) $\rightarrow$ Set value of each function code (third-level menu).
(2) Setting the parameters

Setting the parameters correctly is a precondition to give full play of inverter performance. The following is the introduction on how to set the parameters through keypad panel.
LED keypad operating procedures:
(1) Press the "Fun" key, to enter programming menu.
(2) Press the key "Stop/Reset" or $\quad \ll$, the DGT lamp goes out. Press $\boldsymbol{\Delta}$ and $\boldsymbol{\nabla}$, the function code will change within the function code group. The first number behind F displayed on the panel is 1 , in other words, it displays $\mathrm{F} 1 \times \times$ at this moment.
(3) Press the key "Stop/Reset" or $\square$ , again, the DGT lamp lights up, and the function code will change within the code group. Press $\boldsymbol{\triangle}$ and $\boldsymbol{\nabla}$ to change the function code to F113; press the "Set" key to display 50.00; while press $\boldsymbol{\triangle}$ and $\boldsymbol{\nabla}$ to change to the need frequency.
(4) Press the "Set" key to complete the change.

## The operation of four-line LCD:

When function code shows F100 and the last " 0 " in F100 is flashing, after pressing $\ll$ key, the middle " 0 " is flashing, then press $\ll$ again, " 1 " in F100 is flashing, the flashing value can be changed by pressing " $\boldsymbol{\Delta}$ "/" $\boldsymbol{\nabla}$ " key.

|  | Current status is current frequency | 49.00 Hz <br> Current frequency <br> $49.00 \quad \mathrm{~Hz}$  <br> Current frequency  |  | 48.98 Hz <br> Target frequency <br> 48.98 Hz <br> Current frequency |

Fig 5-5 Operating flow chart of target fiequency/rotate speed adjustments

## (5) Operating instructions of displayed malfunction interface

Fig 5-6 Operating flow chart of displayedmalfunction interface

### 5.2.2 Switching and displaying of status parameters

Under stopped status or running status, LED digitron and four-line LCD of inverter can display status parameters of the inverter. Actual parameters displayed can be selected and set through function codes F131 and F132. Through the "Fun" key, it can switch over repeatedly and display the parameters of stopped status or running status. The followings are the description of operation method of displaying the parameters under stopped status and running status.
(1) Switching of the parameters displayed under stopped status

Under stopped status, inverter has several parameters of stopped status, which can be switched over repeatedly and displayed with the keys "Fun" and "Stop/Reset". These parameters are displayed: keypad jogging, target rotary speed, PN voltage, PID feedback value, temperature, PID given value and count value. Please refer to the description of function code F132.
(2) Switching of the parameters displayed under running status

Under running status, several parameters of running status can be switched over repeatedly and displayed with the keys "Fun". These parameters are displayed: output rotary speed, output current, output voltage, PN voltage, PID feedback value, temperature, count value, linear speed and PID given value. Please refer to the description of function code F131.

### 5.2.3 Operation process of measuring motor parameters

The user shall input the parameters accurately as indicated on the nameplate of the motor prior to selecting operation mode of vector control and auto torque compensation ( $\mathrm{F} 137=3$ ) of V/F control mode. Inverter will match standard motor stator resistance parameters according to these parameters indicated on the nameplate. To achieve better control performance, the user may start the inverter to measure the motor stator resistance parameters, so as to obtain accurate parameters of the motor controlled.
The motor parameters can be tuned through function code F800.
For example: If the parameters indicated on the nameplate of the motor controlled are as follows: numbers of motor poles are 4 ; rated power is 7.5 kW ; rated voltage is 400 V ; rated current is 15.4 A ; rated frequency is 50.00 HZ ; and rated rotary speed is 1440 rpm , operation process of measuring the parameters shall be done as described in the following:

1. In accordance with the above motor parameters, set the values of F801 to F805 correctly: set the value of $\mathrm{F} 801=7.5, \mathrm{~F} 802=400, \mathrm{~F} 803=15.4, \mathrm{~F} 804=4$ and $\mathrm{F} 805=1440$ respectively.
2. In order to ensure dynamic control performance of the inverter, set $\mathrm{F} 800=1$, i.e. select rotating tuning. Make sure that the motor is disconnected from the load. Press the "Run" key on the keypad, and the LED keypad will display "TEST", four-line of LCD will display "parameters measurement...." and it will tune the motor's parameters of two stages. After that, the motor will accelerate according to the acceleration time set at F114 and maintain for a certain period. The speed of motor will then decelerate to 0 according to the time set at F115. After auto-checking is completed, relevant parameters of the motor will be stored in function codes F806~F809, and F800 will turn to 0 automatically. In closed-loop vector control mode, please set F851 according to encoder, the unit is $\mathrm{P} / \mathrm{R}$.
3. If it is impossible to disconnect the motor from the load, select $\mathrm{F} 800=2$, i.e. stationary tuning. Press the "Run" key, the LED keypad will display "TEST", four-line of LCD will display "parameters measurement...." and it will tune the motor's parameters of two stages. The motor's stator resistance, rotor resistance and leakage inductance will be stored in F806-F808 automatically, and F800 will turn to 0 automatically. The user may also calculate and input the motor's mutual inductance value manually according to actual conditions of the motor.

### 5.2.4 Operation process of simple running

## Table 5-1 Brief Introduction to Inverter Operation Process

| Process | Operation | Reference |
| :--- | :--- | :--- |
|  | Install the inverter at a location meeting the technical <br> specifications and requirements of the product. Mainly take into <br> Installation and <br> operation environment <br> consideration the environment conditions (temperature, humidity, <br> etc) and heat radiation of the inverter, to check whether they can <br> satisfy the requirements. | See Chapters I, II, <br> III, |
| Wiring of the inverter | Wiring of input and output terminals of the main circuit; wiring <br> of grounding; wiring of switching value control terminal, <br> analog terminal and communication interface, etc. | See Chapter IV. |

| Checking before getting energized | Make sure that the voltage of input power supply is correct; the input power supply loop is connected with a breaker, the inverter has been grounded correctly and reliably; the power cable is connected to the power supply input terminals of inverter correctly (R/L1, S/L2 terminals for single-phase power grid, and R/L1, S/L2, and T/L3 for three-phase power grid); the output terminals $\mathrm{U}, \mathrm{V}$, and W of the inverter are connected to the motor correctly; the wiring of control terminals is correct; all the external switches are preset correctly; and the motor is under no load (the mechanical load is disconnected from the motor). | See Chapters I~ IV |
| :---: | :---: | :---: |
| Checking immediately after energized | Check if there is any abnormal sound, fuming or foreign flavor with the inverter. Make sure that the display of keypad panel is normal, without any fault alarm message. In case of any abnormality, switch off the power supply immediately. | See Appendix 1 and Appendix 2. |
| Inputting the parameters indicated on the motor's nameplate correctly, and measuring the motor's parameters. | Make sure to input the parameters indicated on the motor nameplate correctly, and study the parameters of the motor. The users shall check carefully, otherwise, serious problems may arise during running. Before initial running with vector control mode, carry out tuning of motor parameters, to obtain accurate electric parameters of the motor controlled. Before carrying out tuning of the parameters, make sure to disconnect the motor from mechanical load, to make the motor under entirely no load status. It is prohibited to measure the parameters when the motor is at a running status. | $\begin{aligned} & \text { See description of } \\ & \text { parameter group } \\ & \text { F800~F830 } \end{aligned}$ |
| Setting running control parameters | Set the parameters of the inverter and the motor correctly, which mainly include target frequency, upper and lower frequency limits, acceleration/deceleration time, and direction control command, etc. The user can select corresponding running control mode according to actual applications. | See description of parameter group. |
| Checking under no load | With the motor under no load, start the inverter with the keypad or control terminal. Check and confirm running status of the drive system. <br> Motor's status: stable running, normal running, correct rotary direction, normal acceleration/deceleration process, free from abnormal vibration, abnormal noise and foreign flavor. <br> Inverter' status: normal display of the data on keypad panel, normal running of the fan, normal acting sequence of the relay, free from the abnormalities like vibration or noise. <br> In case of any abnormality, stop and check the inverter immediately. | See Chapter V. |
| Checking under with load | After successful test run under no load, connect the load of drive system properly. Start the inverter with the keypad or control terminal, and increase the load gradually. When the load is increased to $50 \%$ and $100 \%$, keep the inverter run for a period respectively, to check if the system is running normally. Carry out overall inspection over the inverter during running, to check if there is any abnormality. In case of any abnormality, stop and check the inverter immediately. |  |

|  | Check if the motor is running stably, if the rotary direction of <br> the motor is correct, if there is any abnormal vibration or noise <br> when the motor is running, if the acceleration/deceleration <br> process of the motor is stable, if the output status of the inverter <br> and the display of keypad panel is correct, if the blower fan is <br> run normally, and if there is any abnormal vibration or noise. In <br> case of any abnormality, stop the inverter immediately, and <br> check it after switching off the power supply. |
| :--- | :--- |

### 5.3 Illustration of basic operation

Illustration of inverter basic operation: we hereafter show various basic control operation processes by taking a 7.5 kW inverter that drives a 7.5 kW three-phase asynchronous AC motor as an example.

Figure 5-7 Wiring Diagram 1
The parameters indicated on the nameplate of the motor are as follows: 4 poles; rated power, 7.5 kW ; rated voltage, 400 V ; rated current, 15.4 A ; rated frequency 50.00 HZ ; and rated rotary speed, 1440 rpm .

### 5.3.1 Operation process of frequency setting, start, forward running and stop with keypad panel

(1) Connect the wires in accordance with Figure 5-7. After having checked the wiring successfully, switch on the air switch, and power on the inverter.
(2) Press the "Fun" key, to enter the programming menu.
(3) Measure the parameters of the motor

| Function code | Values |
| :---: | :---: |
| F800 | $1(2)$ |
| F801 | 7.5 |
| F802 | 400 |
| F803 | 15.4 |
| F805 | 1440 |

Press the "Run" key, to measure the parameters of the motor. After completion of the tuning, the motor will stop running, and relevant parameters will be stored in F806~F809. For the details of tuning of motor parameters, please refer to "Operation process of measuring the motor parameters" in this manual and Chapter XII of this manual. (Note: $\mathrm{F} 800=1$ is rotating tuning, $\mathrm{F} 800=2$ is stationary tuning. In the mode of rotating tuning, make sure to disconnect the motor from the load).
(4) Set functional parameters of the inverter:

| Function code | Values |
| :---: | :---: |
| F111 | 50.00 |
| F200 | 0 |
| F201 | 0 |
| F202 | 0 |
| F203 | 0 |

(5) Press the "Run" key, to start the inverter;
(6) During running, current frequency of the inverter can be changed by pressing $\mathbf{\triangle}$ or $\boldsymbol{\nabla}$;
(7) Press the "Stop/Reset" key once, the motor will decelerate until it stops running;
(8) Switch off the air switch, and power off the inverter.

### 5.3.2 Operation process of setting the frequency with keypad panel, and starting, forward and reverse running, and stopping inverter through control terminals

(1) Connect the wires in accordance with Figure 5-2. After having checked the wiring successfully, switch on the air switch, and power on the inverter;

Figure 5-8 Wiring Diagram 2
(2) Press the "Fun" key, to enter the programming menu.
(3) Study the parameters of the motor: the operation process is the same as that of example 1 .
(4) Set functional parameters of the inverter:

| Function code | Values |
| :---: | :---: |
| F111 | 50.00 |
| F203 | 0 |
| F208 | 1 |

(5) Close the switch DI3, the inverter starts forward running;
(6) During running, current frequency of the inverter can be changed by pressing $\mathbf{\Delta}$ or $\boldsymbol{\nabla}$;
(7) During running, switch off the switch DI3, then close the switch DI4, the running direction of the motor will be changed (Note: The user should set the dead time of forward and reverse running F120 on the basis of the load. If it was too short, OC protection of the inverter may occur.)
(8) Switch off the switches DI3 and DI4, the motor will decelerate until it stops running;
(9) Switch off the air switch, and power off the inverter.

### 5.3.3 Operation process of jogging operation with keypad panel

Jogging operation includes two ways.
The first way is as below:
(1) Connect the wires in accordance with Figure 5-7. After having checked the wiring successfully, switch on the air switch, and power on the inverter;
(2) Press the "Fun" key, to enter the programming menu.
(3) Study the parameters of the motor: the operation process is the same as that of example 1.
(4) Set functional parameters of the inverter:

LED keypad parameters setting:

| Function code | Values |
| :---: | :---: |
| F124 | 5.00 |
| F125 | 30 |
| F126 | 30 |
| F132 | 1 |
| F202 | 0 |

(5) Press and hold the "Run" key until the motor is accelerated to the jogging frequency, and maintain the status of jogging operation.
(6) Release the "Run" key, and the motor will decelerate until jogging operation is stopped;
(7) Switch off the air switch, and power off the inverter.

The second way is as below:
(1) Connect the wires in accordance with Figure 5-7. After having checked the wiring successfully, switch on the air switch, and power on the inverter;
(2) Press the "Fun" key, to enter the programming menu.
(3) Study the parameters of the motor: the operation process is the same as that of example 1 .
(4) Set functional parameters of the inverter:

LED keypad parameters setting:

| Function code | Values |
| :---: | :---: |
| F124 | 5.00 |
| F125 | 30 |
| F126 | 30 |
| F132 | 1 |
| F643 | 1 |

Four-line LCD parameters setting:

| Function code | Values |
| :---: | :---: |
| F124 | 5.00 |
| F125 | 30 |
| F126 | 30 |
| F643 | 1 |

(5) When the keypad is LED, press and hold the "Run" key until the motor is accelerated to the jogging frequency, and maintain the status of jogging operation. When the keypads is LCD, press and hold the multifunction key until the motor is accelerated to the jogging frequency, and maintain the status of jogging operation. If $\mathrm{F} 643=2$, motor will reverse jogging.
(6) Release the "Run" key(LED keypad) or multifunction key (LCD keypad). The motor will decelerate until jogging operation is stopped;
(7) Switch off the air switch, and power off the inverter.

### 5.3.4 Operation process of setting the frequency with analog terminal and controlling the operation with control terminals

(1) Connect the wires in accordance with Figure 5-9. After having checked the wiring successfully, switch on the air switch, and power on the inverter. Note: $2 \mathrm{~K} \sim 5 \mathrm{~K}$ potentiometer may be adopted for setting external analog signals. For the cases with higher requirements for precision, please adopt precise multiturn potentiometer, and adopt shielded wire for the wire connection, with near end of the shielding layer grounded reliably.

Figure 5-9 Wiring Diagram 3
(2) Press the "Fun" key, to enter the programming menu.
(3) Study the parameters of the motor: the operation process is the same as that of example 1 .
(4) Set functional parameters of the inverter:

| Function code | Values |
| :---: | :---: |
| F203 | 1 |
| F208 | 1 |

(5) There is a red two-digit coding switch SW1 near the control terminal block of 22 kW inverter and below 22 kW , as shown in Figure 5-10. The function of coding switch is to select the voltage signal ( $0 \sim$ $5 \mathrm{~V} / 0 \sim 10 \mathrm{~V}$ ) or current signal of analog input terminal AI2, current channel is default. In actual application, select the analog input channel through F203. And select voltage or current signal by F439.Turn switches 1 to ON and 2 to ON as illustrated in the figure, and select $0 \sim 20 \mathrm{~mA}$ current speed control. Another switches states and mode of control speed are as table 5-2.
(6) There is a red four-digit coding switch SW1 near the control terminal block of above 30 kW inverter, as shown in Figure $5-11$. The function of coding switch is to select the input range ( $0 \sim 5 \mathrm{~V} / 0 \sim$ $10 \mathrm{~V} / 0 \sim 20 \mathrm{~mA}$ ) of analog input terminal AI1 and AI2. In actual application, select the analog input channel through F203. And select voltage or current signal by F438 and F439AI1 channel default value is $0 \sim 10 \mathrm{~V}$, AI2 channel default value is $0 \sim 20 \mathrm{~mA}$. Another switches states and mode of control speed are as table 5-3.
(7) There is a toggle switch S1 at the side of control terminals, please refer to Fig 5-12. S1 is used to select the voltage input range of AI1 channel. When turning S 1 to " + ", the input range is $0 \sim 10 \mathrm{~V}$, when turning S1 to "-", the input range is $-10 \sim 10 \mathrm{~V}$.
(8) Close the switch DI3, the motor starts forward running;
(9) The potentiometer can be adjusted and set during running, and the current setting frequency of the inverter can be changed;
(10) During running process, switch off the switch DI3, then, close DI4, the running direction of the motor will be changed;
(11) Switch off the switches DI3 and DI4, the motor will decelerate until it stops running;
(12) Switch off the air switch, and power off the inverter.
(13) Analog output terminal AO2 can only output current signal, AO1 terminal can output voltage and current signal, the selecting switch is J 5 , please refer to Fig 5-13, the output relation is shown in table 5-4.

Fig 5-12

Fig 5-13

Table 5-2 The Setting of Coding Switch and Parameters in the Mode of Analog Speed Control

| F203=2, channel AI2 is selected |  |  |  | F203=1, channel AI1 is selected |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Parameter | SW1 coding switch |  |  | S1 toggle switch |  |
| F439 | Coding <br> Switch 1 | Coding <br> Switch 2 | Mode of Speed <br> Control | + | - |
| 0 | OFF | OFF | $0 \sim 5 \mathrm{~V}$ voltage | $0 \sim 10 \mathrm{~V}$ voltage | $-10 \sim 10 \mathrm{~V}$ voltage |
| 0 | OFF | ON | $0 \sim 10 \mathrm{~V}$ voltage |  |  |
| 1 | ON | ON | $0 \sim 20 \mathrm{~mA}$ current |  |  |

Table 5-3 The Setting of Coding Switch and Parameters in the Mode of Analog Speed Control

|  | Set F203 to 1, to select channel AI1 |  |  |  | Set F203 to 2, to select channel AI2 |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Para. | Coding Switch SW1 |  | Toggle <br> switch <br> S1 | Analog signal range | Para. | Coding | itch SW |  |

## VI. Function Parameters

### 6.1 Basic parameters

| F100 User's Password | Setting range: $0 \sim 9999$ | Mfr's value: 0 |
| :--- | :--- | :--- | :--- |

-When F107=1 with valid password, the user must enter correct user's password after power on or fault reset if you intend to change parameters. Otherwise, parameter setting will not be possible, and a prompt "Err1" will be displayed on the LED keypad, and "password is incorrect" will be displayed on the LCD keypad.

Relating function code: F107 Password valid or not F108 Setting user's password

| F102 Inverter's Rated Current (A) |  | Mfr's value: Subject to inverter model |
| :--- | :--- | :--- |
| F103 Inverter Power (kW) |  | Mfr's value: Subject to inverter model |
| F104 Voltage level |  | Mfr's value: Subject to inverter model |

- Rated current, rated power and voltage level can only be checked but cannot be modified.

| F105 | Software Edition No. | Setting range: $1.00 \sim 10.00$ | Mfr's value: Subject to inverter model |
| :--- | :--- | :--- | :--- |

Software Edition No. can only be checked but cannot be modified.

|  |  | Setting range: |  |
| :--- | :--- | :--- | :--- |
| F106 | Control mode | 0:Sensorless vector control (SVC); |  |
|  |  | 1: Closed-loop vector control (VC); | Mfr's value: 2 |
|  | 2: V/F; 3: Vector control 1 |  |  |
|  | 6: PMSM sensorless vector control |  |  |

$\cdot 0$ : Sensorless vector control is suitable for the application of high-performance requirement. One inverter can only drive one motor.

1: Closed-loop vector control is suitable for the application of high-precision speed control and torque control. One inverter can only drive one motor, and the motor must install encoder. Encoder must be installed, and please set F851 and F854 correctly.
$\cdot 2$ : V/F control is suitable for common requirement of control precision or one inverter drives several motors.
-3: Vector control 1 is auto torque promotion, which has the same function of $\mathrm{F} 137=3$. While studying motor parameters, motor does not need to be disconnected with load. One inverter can only drive one motor.
6: PMSM sersorless vector control is suitable for the application of high-performance requirement. One inverter can only drive one motor.
Note:

1. It is necessary to study the parameters of motor before inverter runs in the vector control mode (F106=0, 1, 3 and 6 ).
2. Under vector control mode (F106=0, 1, 3 and 6), one inverter can only drive one motor and the power of motor should be similar to the power of inverter. Otherwise, control performance will be increased or system cannot work properly.
3. Under vector control mode (F106=0 and 1), the max frequency (F111) must be lower than 500.00 Hz .
4. The operator may input motor parameters manually according to the motor parameters given by motor manufactures.
5. Usually, the motor will work normally by inverter's default parameters, but the inverter's best control performance will not be acquired. Therefore, in order to get the best control performance, please study the parameters of motor before inverter runs in the vector control mode.

| F107 Password Valid or Not | Setting range: $0:$ invalid; 1: valid <br> 2: Invalid for communication <br> 3: Menu lock screen enabled | Mfr's value: 0 |  |
| :--- | :--- | :--- | :--- |
| F108 | Setting User's Password | Setting range: $0 \sim 9999$ | Mfr's value: 8 |

-When F107 is set to 0 , the function codes can be changed without inputting the password.
-When F107 is set to 1 , the function codes can be changed only after inputting the user's password by F100.
-When F107 is set to 2, there is no need to input password when communication, the function codes can be changed.
-When F107 is set to 3, the function codes can be changed only after inputting the user's password by F100.
-The user can change "User's Password". The operation process is the same as those of changing other parameters.

- Input the value of F108 into F100, and the user's password can be unlocked.

Note: When password protection is valid, and if the user's password is not entered, F108 will display 0.

| F109 | Starting Frequency (Hz) | Setting range: $0.00 \sim 10.00$ | Mfr's value: 0.00 |
| :--- | :--- | :--- | :--- |
| F110 | Holding Time of Starting Frequency (S) | Setting range: $0.0 \sim 999.9$ | Mfr's value: 0.0 |

$\cdot$ The inverter begins to run from the starting frequency. If the target frequency is lower than starting frequency, F109 is invalid.
-The inverter begins to run from the starting frequency. After it keeps running at the starting frequency for the time as set in F110, it will accelerate to target frequency. The holding time is not included in acceleration/deceleration time.
-Starting frequency is not limited by the Min frequency set by F112. If the starting frequency set by F109 is lower than Min frequency set by F112, inverter will start according to the setting parameters set by F109 and F110. After inverter starts and runs normally, the frequency will be limited by frequency set by F111 and F112. -Starting frequency should be lower than Max frequency set by F111.
Note: when speed track is adopted, F109 and F110 are invalid.

| F111 | Max Frequency $(\mathrm{Hz})$ | Setting range: F113 $\sim 590.0$ | Mfr's value: 50.00 |
| :--- | :--- | :--- | :--- |
| F112 | Min Frequency $(\mathrm{Hz})$ | Setting range: $0.00 \sim$ F113 | Mfr's value: 0.50 |

- Max frequency is set by F111.

Note: in vector control mode (F106=0,1), the max frequency should be lower than 500 Hz .

- Min frequency is set by F112.
- The setting value of min frequency should be lower than target frequency set by F113.
- The inverter begins to run from the starting frequency. During running process, if the given frequency is lower than min frequency, then inverter will stop.
Max/Min frequency should be set according to the nameplate parameters and running situations of motor. The motor is forbidden running at low frequency for a long time, or else motor will be damaged because of overheat.

| F113 | Target Frequency $(\mathrm{Hz})$ | Setting range: F112~F111 | Mfr's value: 50.00 |
| :--- | :--- | :--- | :--- |

$\cdot$ It shows the preset frequency. Under keypad speed control or terminal speed control mode, the inverter will run to this frequency automatically after startup.

| F114 | First Acceleration Time (S) |  |  |
| :--- | :--- | :--- | :--- |
| F115 | First Deceleration Time (S) | Setting range: | Mfr's value: subject to inverter model |
| F116 | Second Acceleration Time (S) |  |  |
| F117 | Second Deceleration Time (S) |  |  |

F119 is used to set the reference of setting accel/decel time.

- The Acceleration/Deceleration time can be chosen by multifunction digital input terminals F316~F323 and connecting DI terminal with CM terminal. Please refer to the instructions of multi-functional input terminals. Note: when speed track is working, acceleration/deceleration time, min frequency and target frequency are invalid. After speed track is finished, inverter will run to target frequency according to acceleration/deceleration time.

| F118 | Turnover Frequency (Hz) | Setting range: $15.00 \sim 590.0$ | Mfr's value: 50.00 |
| :--- | :--- | :--- | :--- |

- Turnover frequency is the final frequency of V/F curve, and also is the least frequency according to the highest output voltage.
-When running frequency is lower than this value, inverter has constant-torque output. When running frequency exceeds this value, inverter has constant-power output.
Note: during the process of speed track, turnover frequency is invalid. After speed track is finished, this function code is valid.

F119 The reference of setting accel/decel time

| Setting range: |  |
| :--- | :--- |
| $0: 0 \sim 50.00 \mathrm{~Hz}$ | Mfr's value: 0 |
| 1: $0 \sim$ max frequency |  |
| 2: $0 \sim$ target frequency |  |

When F119 $=0$, acceleration/ deceleration time means the time for inverter to accelerate/ decelerate from 0 Hz $(50 \mathrm{~Hz})$ to $50 \mathrm{~Hz}(0 \mathrm{~Hz})$.
When F119=1, acceleration/ deceleration time means the time for inverter to accelerate/ decelerate from 0 Hz (max frequency) to max frequency $(0 \mathrm{~Hz})$.
When F119=2, acceleration/ deceleration time means the time for inverter to accelerate/ decelerate from 0 Hz (target frequency) to target frequency $(0 \mathrm{~Hz})$.

| F120 | Forward / Reverse Switchover dead-Time (S) | Setting range: $0.0 \sim 3000$ | Mfr's value: 0.0 |
| :--- | :--- | :--- | :--- |

- Within "forward/ reverse switchover dead-time", this latency time will be canceled upon receiving "stop" signal. This function is suitable for all the speed control modes except automatic cycle operation.
- This function can ease the current impact in the process of direction switchover.

Note: during the process of speed track, F120 is invalid. After speed track is finished, this function code is valid.

| F121 VF additional compensation | Setting range: 0: Invalid 1: Valid | Mfr's value:0 |
| :--- | :--- | :--- |

-This function is used to increase output torque. Please set accurate motor parameters and auto-tune motor stator resistor.
Note: when one inverter drives several motors, please close this function.

| F122 | Reverse Running Forbidden | Setting range: 0 : invalid; $1:$ valid | Mfr's value: 0 |
| :--- | :--- | :--- | :--- |

When F122=1, inverter will only run forward no matter the state of terminals and the parameters set by F202. Inverter will not run reverse and forward / reverse switchover is forbidden. If reverse signal is given, inverter will stop. If reverse running locking is valid ( $\mathrm{F} 202=1$ ), whatever speed track is valid or not, inverter has no output. When $F 122=1$, F613=1 and inverter gets forward running command and motor is sliding reverse, if inverter can detect the sliding direction and track to motor speed, then inverter will run to 0.0 Hz reverse, then run forward
according to the setting value of parameters.

| F123 Minus frequency is valid in the mode of combined speed control. | $0:$ Invalid; 1: valid | 0 |
| :--- | :--- | :--- |

$\cdot$ In the mode of combined speed control, if running frequency is minus and $\mathrm{F} 123=0$, inverter will stop; if $\mathrm{F} 123=1$, inverter will run reverse at this frequency. (This function is controlled by F122.)

| F124 | Jogging Frequency (Hz) | Setting range: F112~F111 |  | Mfr's value: 5.00 |
| :--- | :--- | :--- | :--- | :--- |
| F125 | Jogging Acceleration Time (S) | Setting range: | Mfr's value: subject to inverter model |  |
|  | F126 | Jogging Deceleration Time (S) |  |  |

-There are two types of jogging: keypad jogging and terminal jogging. Keypad jogging is valid only under stopped status (F132 including of displaying items of keypad jogging should be set) Terminal jogging is valid under both running status and stopped status.
-Carry out jogging operation through the keypad (under stopped status):
a. Press the "Fun" key, it will display "HF-0";
b. Press the "Run" key, the inverter will run tc "jogging frequency" (if pressing "Fun" key again, "keypad jogging" will be cancelled).

Figure 6-1 Jogging Operation
-In case of terminal jogging, make "jogging" terminal (such as DI1) connected to CM, and inverter will run to jogging frequency. The rated function codes are from F316 to F323.
Note: when jogging function is valid, speed track function is invalid.

| F127/F129 | Skip Frequency A,B (Hz) | Setting range: $0.00 \sim 590.0$ | Mfr's value:0.00 |
| :--- | :--- | :--- | :--- |
| F128/F130 | Skip Width A,B (Hz) | Setting range: $0.00 \sim 2.50$ | Mfr's value: 0.00 |

- Systematic vibration may occur when the motor is running at a certain frequency. This parameter is set to skip this frequency.
-The inverter will skip the point automatically when output frequency is equal to the set value of this parameter.
"Skip Width" is the span from the upper to the lower limits around Skip Frequency. For example Skip Frequency $=20 \mathrm{~Hz}$, Skip Width $=0.5 \mathrm{~Hz}$, inverter will skip automatically when output is between $19.5 \sim 20.5 \mathrm{~Hz}$.

Figure 6-2 Skip Frequency
-Inverter will not skip this frequency span during acceleration/deceleration.
Note: during the process of speed track, skip frequency function is invalid. After speed track is finished, this function is valid.

| F131 Running Display Items | 0-Current output frequency/function-code <br> 1-Output rotary speed <br> 2-Output current <br> 4-Output voltage <br> 8-PN voltage <br> 16-PID feedback value <br> 32-Temperature <br> 64-Count values <br> 128-Linear speed <br> 256 - PID given value <br> 512-Yarn length <br> 1024-Center frequency <br> 2048 - Output power <br> 4096- Output torque | Mfr's value: $0+1+2+4+8=15$ |
| :---: | :---: | :---: |

Selection of one value from $1,2,4,8,16,32,64$ and 128 shows that only one specific display item is selected. Should multiple display items be intended, add the values of the corresponding display items and take the total values as the set value of F131, e.g., just set F131 to be $19(1+2+16)$ if you want to call "current output rotary speed", "output current" and "PID feedback value". The other display items will be covered.
$\cdot$ As F131 $=8191$, all display items are visible, of which, "frequency/function-code" will be visible whether or not it is selected.
-Should you intend to check any display item of LED keypad, just press the "Fun" key for switchover.
Should you intend to check any display item of four-line LCD, press "Fun" key and press $\lll$ key to check them.
-Whatever the value of F131 is set to, corresponding target frequency will flash under stopped status.
The units and representing methods for each physical quantity in LED keypad are displayed as below:
Target rotary speed is an integral number. If it exceeds 9999 , add a decimal point to it.
Current display A *.* Voltage display U*** Count value **** Temperature H***
Linear speed $L^{* * *}$. If it exceeds 999 , add a decimal point to it. If it exceeds 9999 , add two decimal points to it, and the like.
PID given value o*.* PID feedback value b*.* Yarn length * center frequency *.** output power *.* output torque *.*
Note: when count value is displayed and it exceeds 9999 , only 4 digits are displayed and add a decimal point to it, i.e. 12345 is displayed in the form of 1234.
-In four-line LCD interface, the displayed item will be shown alternately on the fourth line of level 3 menu in F131.

|  |  | Setting range: 0: Frequency/function-code |  |
| :--- | :--- | :--- | :--- |
|  |  | 1: Keypad jogging |  |
| F132 Target rotary speed |  |  |  |
|  |  | Display items of stop | 4: PN voltage |
|  |  | 8: PID feedback value |  |
|  |  | 16: Temperature 32: Count values | Mfr's value: |
|  | 64: PID given value 128: Yarn length | $0+2+4=6$ |  |
|  | 256: Center frequency |  |  |
| 512: Setting torque |  |  |  |
| F133 | Drive ratio of driven system | Setting range: $0.10 \sim 200.0$ |  |
|  | F134 | Transmission-wheel radius | $0.001 \sim 1.000(\mathrm{~m})$ |

-Calculation of rotary speed and linear speed:
For example, If inverter's max frequency $\mathrm{F} 111=50.00 \mathrm{~Hz}$, numbers of motor poles $\mathrm{F} 804=4$, drive ratio $\mathrm{F} 133=1.00$, transmission-shaft radius $\mathrm{R}=0.05 \mathrm{~m}$, then

Transmission shaft perimeter: $2 \pi \mathrm{r}=2 \times 3.14 \times 0.05=0.314$ (meter)
Transmission shaft rotary speed: $60 \times$ operation frequency/ (numbers of poles pairs $\times$ drive ratio)
$=60 \times 50 /(2 \times 1.00)=1500 \mathrm{rpm}$
Endmost linear speed: rotary speed $\times$ perimeter $=1500 \times 0.314=471$ (meters $/$ second)

| F135 | User macro | Setting range: <br> $0:$ Invalid 1: user macro 1 2: user macro 2 |
| :--- | :--- | :--- |
| Mfr's value: 0 |  |  |

When $\mathrm{F} 135=0$, user macro parameters are not saved.
When $\mathrm{F} 135=1$, all setting parameters are saved in user macro 1 .
When $\mathrm{F} 135=2$, all setting parameters are saved in user macro 2 .
After macro is saved, user can check macro by setting F160 $=21$ or $\mathrm{F} 160=22$.

| F136 | Slip compensation (\%) | Setting range: $0 \sim 10$ | Mfr's value: 0 |
| :--- | :--- | :--- | :--- |

- Under V/F controlling, rotary speed of motor rotor will decrease as load increases. Be assured that rotor rotate speed is near to synchronization rotary speed while motor with rated load, slip compensation should be adopted according to the setting value of frequency compensation.

Note: during the process of speed track, slip compensation function is invalid. After speed track is finished, this function is valid.

|  |  | Setting range: |  |
| :--- | :--- | :--- | :--- |
|  |  | 0: Linear compensation; |  |
| F137 Modes of torque compensation | 1: Square compensation; |  |  |
|  |  | 2: User-defined multipoint compensation | Mfr's value: 0 |
|  |  | 3: Auto torque compensation |  |
|  | 4: V/F separation |  |  |

| F138 Linear compensation | Setting range: $1 \sim 20$ | Mfr's value: subject to inverter model |
| :---: | :---: | :---: |
| F139 Square compensation | Setting range: $1: 1.5$ $2: 1.8$ <br>  $3: 1.9$ $4: 2.0$ <br>  5~6: Reserved  | Mfr's value: 1 |

When $\mathrm{F} 106=2$, the function of F137 is valid.
To compensate low-frequency torque controlled by V/F, output voltage of inverter while low-frequency should be compensated.

When F137 $=0$, linear compensation is chosen and it is applied on universal constant-torque load;
When F137=1, square compensation is chose and it is applied on the loads of fan or water pump;
When F137=2, user-defined multipoint compensation is chosen and it is applied on the special loads of spin-drier or centrifuge;

This parameter should be increased when the load is heavier, and this parameter should be decreased when the load is lighter.

Fig 6-3 Torque Promotion

If the torque is elevated too much, motor is easy to overheat, and the current of inverter will be too high. Please check the motor while elevating the torque. When $\mathrm{F} 137=3$, auto torque compensation is chose and it can compensate low-frequency torque automatically, to diminish motor slip, to make rotor rotary speed close to synchro rotary speed and to restrain motor vibration. Customers should set correctly motor power, rotary speed, numbers of motor poles, motor rated current and stator resistance. Please refer to the chapter "Operation process of measuring motor parameters".
When F137=4, output voltage is not related to output frequency, output frequency is controlled by frequency source, and output voltage is controlled by F671.

| F140 Voltage compensation point <br> frequency (Hz) | Setting range: $0.00 \sim$ F142 | Mfr's value: 1.00 |
| :--- | :--- | :--- |
| F141 Voltage compensation point $1(\%)$ | Setting range: $0 \sim 30$ | Mfr's value: 0 |
| F142 User-defined frequency point F2 | Setting range: F140~F144 | Mfr's value: 5.00 |
| F143 User-defined voltage point V2(\%) | Setting range: $0 \sim 100$ | Mfr's value: 13 |
| F144 User-defined frequency point F3 | Setting range: F142~F146 | Mfr's value: 10.00 |
| F145 User-defined voltage point V3(\%) | Setting range: $0 \sim 100$ | Mfr's value: 24 |

| F146 $\quad$ User-defined frequency point F4 | Setting range: F144~F148 | Mfr's value: 20.00 |
| :--- | :--- | :--- | :--- |
| F147 $\quad$ User-defined voltage point V4(\%) | Setting range: $0 \sim 100$ | Mfr's value: 45 |
| F148 $\quad$ User-defined frequency point F5 | Setting range: F146~F150 | Mfr's value: 30.00 |
| F149 $\quad$ User-defined voltage point V5(\%) | Setting range: $0 \sim 100$ | Mfr's value: 63 |
| F150 $\quad$ User-defined frequency point F6 | Setting range: F148~F118 | Mfr's value: 40.00 |
| F151 $\quad$ User-defined voltage point V6(\%) | Setting range: $0 \sim 100$ | Mfr's value: 81 |

AS shown in Fig6-3, when F317=0, VF curve compensation $=\operatorname{Max}$ (F138, F141)

> When $\mathrm{F} 137=1$, VF curve compensation $=\mathrm{Max}(\mathrm{F} 139, \mathrm{~F} 141)$
> When $\mathrm{F} 137=2$, VF curve compensation $=\mathrm{Max}$ (auto compensation, F141)
> When $F 317=3$, auto compensation.

F141 cannot be set to high, otherwise, inverter will easily trip into OH and OC.
Multi-stage V/F curves are defined by 12 parameters from F140 to F151.
The setting value of $\mathrm{V} / \mathrm{F}$ curve is set by motor load characteristic.
Note: $\mathrm{V} 1<\mathrm{V} 2<\mathrm{V} 3<\mathrm{V} 4<\mathrm{V} 5<\mathrm{V} 6, \mathrm{~F} 1<\mathrm{F} 2<\mathrm{F} 3<\mathrm{F} 4<\mathrm{F} 5<\mathrm{F} 6$. As low-frequency, if the setting voltage is too high, motor will overheat or be damaged. Inverter will be stalling or occur over-current protection.

Fig 6-4 Polygonal-Line Type V/F
Note: during the process of speed track, polygonal-line V/F curve function is invalid. After speed track is finished, this function is valid.

| F152 Output voltage corresponding to turnover frequency | Setting range: $10 \sim 100$ | Mfr's value: 100 |
| :--- | :--- | :--- |

This function can meet the needs of some special loads, for example, when the frequency outputs 300 Hz and corresponding voltage outputs 200 V (supposed voltage of inverter power supply is 400 V ), turnover
frequency F118 should be set to 300 Hz and F152 is set to $(200 \div 400) \times 100=50$. And F 152 should be equal to 50 .
Please pay attention to nameplate parameters of motor. If the working voltage is higher than rated voltage or the frequency is higher than rated frequency, motor would be damaged.

Note: during the process of speed track, slip compensation function is invalid. After speed track is finished, this function is valid.

| F153 | Carrier frequency setting | Setting range: subject to model | Mfr's value: subject to model |
| :--- | :--- | :--- | :--- |

Carrier-wave frequency of inverter is adjusted by setting this code function. Adjusting carrier-wave may reduce motor noise, avoid point of resonance of mechanical system, decrease leakage current of wire to earth and the interference of inverter.
When carrier-wave frequency is low, although carrier-wave noise from motor will increase, the current leaked to the earth will decrease. The wastage of motor and the temperature of motor will increase, but the temperature of inverter will decrease.
When carrier-wave frequency is high, the situations are opposite, and the interference will raise.
When output frequency of inverter is adjusted to high frequency, the setting value of carrier-wave should be increased. Performance is influenced by adjusting carrier-wave frequency as below table:

| Carrier-wave frequency | Low | $\rightarrow$ | High |
| :--- | :--- | :--- | :--- |
| Motor noise | Loud | $\rightarrow$ | Low |
| Waveform of output current | Bad | $\rightarrow$ | Good |
| Motor temperature | High | $\rightarrow$ | Low |
| Inverter temperature | Low | $\rightarrow$ | High |
| Leakage current | Low | $\rightarrow$ | High |
| Interference | Low | $\rightarrow$ | High |

| F154 Automatic voltage rectification | Setting range: 0 : Invalid 1: Valid <br> 2:Invalid during deceleration process | Mfr's value: 0 |
| :--- | :--- | :--- |

This function is enable to keep output voltage constant automatically in the case of fluctuation of input voltage, but the deceleration time will be affected by internal PI adjust. If deceleration time is forbidden being changed, please select F154=2.

| F155 Digital accessorial frequency setting | Setting range: $0.00 \sim \mathrm{~F} 111$ | Mfr's value: 0.00 |
| :--- | :--- | :--- |
| F156 Digital accessorial frequency polarity setting | Setting range: $0 \sim 1$ | Mfr's value: 0 |
| F157 Reading accessorial frequency |  |  |
| F158 Reading accessorial frequency polarity |  |  |

Under combined speed control mode, when accessorial frequency source is digital setting memory (F204=0), F155 and F156 are considered as initial set values of accessorial frequency and polarity (direction).
In the mode of combined speed control, F157 and F158 are used for reading the value and direction of accessorial frequency.
For example, when F203=1, F204=0. F207=1, the given analog frequency is 15 Hz , inverter is required to run to 20 Hz . In case of this requirement, user can push "UP" button to raise the frequency from 15 Hz to 20 Hz . User can also set
$\mathrm{F} 155=5 \mathrm{~Hz}$ and $\mathrm{F} 160=0$ ( 0 means forward, 1 means reverse). In this way, inverter can be run to 20 Hz directly.

| F159 | Random carrier-wave selection | Setting range: 0 : Invalid 1: Valid | Mfr's value: 0 |
| :--- | :--- | :--- | :--- |

When F159=0, inverter will modulate as per the carrier-wave set by F153. When F159=1, inverter will operate in mode of random carrier-wave modulating.
Note: when random carrier-wave is selected, output torque will increase but noise will be loud. When the carrier-wave set by F153 is selected, noise will be reduced, but output torque will decrease. Please set the value according to the situation.

F160 Reverting to manufacturer values

| Setting range: 0: Invalid 1: Valid |  |
| :--- | :--- |
| 21: revert user macro 1 |  |
| 22: revert user macro 2 |  | 22: revert user macro 2

-When there is disorder with inverter's parameters and manufacturer values need to be restored, set $\mathrm{F} 160=1$. After "Reverting to manufacturer values" is done, F160 values will be automatically changed to 0 .
After setting F135, user can check the parameters of related macro parameters by setting F160. When $F 160=21$, the parameters of macro 1 are reverted. When $\mathrm{F} 160=22$, the parameters of macro are reverted.
. "Reverting to manufacturer values" will not work for the function-codes marked " $\circ$ "in the "change" column of the parameters table. These function codes have been adjusted properly before delivery. And it is recommended not to change them.

Figure 6-5 Reverting to manufacturer values

### 6.2 Operation Control

| F200 |  | Setting range: |  |
| :--- | :--- | :--- | :--- |
|  | Source of start | 0: Keypad command; |  |
|  | command | 1: Terminal command; 2: Keypad+Terminal; | Mfr's value: 4 |
| 3: MODBUS; 4: Keypad+Terminal+MODBUS |  |  |  |
|  |  | Setting range: |  |
|  | Source of stop | 0: Keypad command; |  |
|  | command | 1: Terminal command; 2: Keypad+Terminal; | Mfr's value: 4 |
|  | 3: MODBUS; 4: Keypad+Terminal+MODBUS |  |  |

- F200 and F201 are the resource of selecting inverter control commands.
- Inverter control commands include: starting, stopping, forward running, reverse running, jogging, etc.
."Keypad command" refers to the start/stop commands given by the "Run" or "stop/reset" key on the keypad.
"Terminal command" refers to the start/stop command given by the "Run" terminal defined by F316-F323.
-When $\mathrm{F} 200=3$ and $\mathrm{F} 201=3$, the running command is given by MODBUS.
-When $\mathrm{F} 200=2$ and $\mathrm{F} 201=2$, "keypad command" and "terminal command" are valid at the mean time, $F 200=4$ and $F 201=4$ are the same.

|  | Setting range: <br> 0: Forward running locking; <br> F202 <br> Mode of direction setting | 1: Reverse running locking; |
| :--- | :--- | :--- |
|  | 2: Terminal setting |  |
|  | 3: Keypad setting | Mfr's value: 0 |
|  | 4: Keypad setting and direction in memory |  |

$\cdot$ The running direction is controlled by this function code together with other speed control mode which can set the running direction of inverter. When auto-circulation speed is selected by $\mathrm{F} 500=2$, this function code is not valid.
-When speed control mode without controlling direction is selected, the running direction of inverter is controlled by this function code, for example, keypad controls speed.

| Direction given by F202 | Direction given by other <br> control mode | Running direction | remarks |
| :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 0 means forward. |
| 0 | 1 | 1 |  |
| 1 | 0 | 1 |  |
| 1 | 1 | 0 |  |

When F202=3, the running direction can be changed by pressing FWD/REV key. After power off and repower on the inverter, the default running direction is forward.

When F202=4, the running direction can be changed by pressing FWD/REV key. The setting direction by keypad is in memory.

|  | Setting range: |  |
| :---: | :--- | :--- |
|  | 0: Memory of digital given; |  |
|  | 1: External analog AI1; |  |
| F203 | 2: External analog AI2; |  |
| Main frequency source X | 3: Pulse input given; |  |
|  | 4: Stage speed control; |  |
|  | 5: No memory of digital given; 0 |  |
|  | 6: Keypad potentiometer; 7: Reserved; |  |
|  | 8:Reserved; 9: PID adjusting; 10: MODBUS |  |

- Main frequency source is set by this function code.
$\cdot 0$ : Memory of digital given
Its initial value is the value of F113. The frequency can be adjusted through the key "up" or "down", or through the "up", "down" terminals.
"Memory of digital given" means after inverter stops, the target frequency is the running frequency before stop. If the user would like to save target frequency in memory when the power is disconnected, please set $\mathrm{F} 220=1$, i.e. frequency memory after power down is valid.

1: External analog AI1; 2: External analog AI2
The frequency is set by analog input terminal AI1 and AI2. The analog signal may be current signal $(0-20 \mathrm{~mA}$ or $4-20 \mathrm{~mA})$ or voltage signal $(0-5 \mathrm{~V}$ or $0-10 \mathrm{~V})$, which can be chosen by switch code. Please adjust the switch code according to practical situations, refer to fig 5-4 and table 5-2.
When inverters leave the factory, the analog signal of AI1 channel is DC voltage signal, the range of voltage is $0-10 \mathrm{~V}$, and the analog signal of AI2 channel is DC current signal, the range of current is $0-20$ mA . If $4-20 \mathrm{~mA}$ current signal is needed, please set lower limit of analog input $\mathrm{F} 406=2$, which input resistor is 500 OHM . If some errors exist, please make some adjustments.
3: Pulse input given
When frequency is given by pulse input, the pulse is only inputted by DI1 terminal. The max pulse frequency is 10 K . The related parameters are from F440 to F446.

## 4: Stage speed control

Multi-stage speed control is selected by setting stage speed terminals F316-F323 and function codes of multi-stage speed section. The frequency is set by multi-stage terminal or automatic cycling frequency.

5: No memory of digital given
Its initial value is the value of F113. The frequency can be adjusted through the key "up" or "down", or through the "up", "down" terminals.
"No memory of digital given" means that the target frequency will restore to the value of F113 after stop no matter the state of F220.

## 6: Keypad Potentiometer AI3

The frequency is set by the analog on the control panel. When the potentiometer in remote keypad is used, please set $\mathrm{F} 422=1$.

9: PID adjusting

When PID adjusting is selected, the running frequency of inverter is the value of frequency adjusted by PID. Please refer to instructions of PID parameters for PID given resource, PID given numbers, feedback source, and so on.

10: MODBUS
The main frequency is given by MODBUS communication.

|  | Setting range: |  |
| :--- | :--- | :--- |
| F204 Accessorial frequency | 0: Memory of digital given; 1: External analog AI1; |  |
| source Y | 2: External analog AI2; | 3: Pulse input given; |
|  | 4: Stage speed control; $\quad$ M: PID adjusting; |  |
|  | 6: Keypad potentiometer AI3 |  |

- When accessorial frequency Y is given to channel as independent frequency, it has the same function with main frequency source $X$.
- When F204=0, the initial value of accessorial frequency is set by F155. When accessorial frequency controls speed independently, polarity setting F156 is not valid.
- When F207=1 or 3, and F204=0, the initial value of accessorial frequency is set by F155, the polarity of accessorial frequency is set by F156, the initial value of accessorial frequency and the polarity of accessorial frequency can be checked by F157 and F158.
- When the accessorial frequency is given by analog input (AI1, AI2), the setting range for the accessorial frequency is set by F205 and F206.
- Note: accessorial frequency source Y and main frequency source X can not use the same frequency given channel.

| F205 reference for selecting accessorial <br> frequency source Y range | Setting range: <br> $0:$ Relative to max frequency; <br> 1: Relative to main frequency X | Mfr's value: 0 |
| :--- | :--- | :--- |
| F206 Accessorial frequency Y range (\%) | Setting range: $0 \sim 150$ | Mfr's value: 100 |

- When combined speed control is adopted for frequency source, F206 is used to confirm the relative object of the setting range for the accessorial frequency.
F205 is to confirm the reference of the accessorial frequency range. If it is relative to main frequency, the range will change according to the change of main frequency X .

| F207 Frequency source selecting | Setting range: <br> $0: \mathrm{X} ; 1: \mathrm{X}+\mathrm{Y}$; <br> 2: X or Y (terminal switchover); <br> 3: X or $\mathrm{X}+\mathrm{Y}$ (terminal switchover); <br> 4: Combination of stage speed and analog <br> 5: X-Y 6: X+Y-Y MAX $^{*} 50 \%$ <br> 7: combination 1 of stage speed and digital <br> 9: X/Y 10: Max (X,Y) 11: Min (X,Y) | Mfr's value: 0 |
| :---: | :---: | :---: |

Select the channel of setting the frequency. The frequency is given by combination of main frequency X and accessorial frequency Y .
-When $\mathrm{F} 207=0$, the frequency is set by main frequency source.
-When $\mathrm{F} 207=1, \mathrm{X}+\mathrm{Y}$, the frequency is set by adding main frequency source to accessorial frequency source. X or Y can be given by PID.
-When F207=2, main frequency source and accessorial frequency source can be switched over by frequency source switching terminal.
-When F207=3, main frequency given and adding frequency given $(\mathrm{X}+\mathrm{Y})$ can be switched over by frequency source switching terminal. X or Y can be given by PID.
-When $\mathrm{F} 207=4$, stage speed setting of main frequency source has priority over analog setting of accessorial frequency source (only suitable for F203=4 F204=1).
-When F207=5, X-Y, the frequency is set by subtracting accessorial frequency source from main frequency source. If the frequency is set by main frequency or accessorial frequency, PID speed control can be selected.
$\cdot$ When $\mathrm{F} 207=6, \mathrm{X}+\mathrm{Y}-\mathrm{Y}_{\mathrm{MAX}} * 50 \%$, the frequency is given by both main frequency source and accessorial frequency source. X or Y can be given by PID. When F205=0, $\mathrm{Y}_{\mathrm{MAX}}=\mathrm{F} 111 * \mathrm{~F} 206$. When F205=1, $\mathrm{Y}_{\mathrm{MAX}}=\mathrm{X} * \mathrm{~F} 206$.
-When $\mathrm{F} 207=7$, stage speed setting of main frequency source has priority over digital of accessorial frequency source. (only suitable for $\mathrm{F} 203=4$, $\mathrm{F} 204=0$ ).
-When $\mathrm{F} 207=9$, target frequency is main frequency source X dividing accessorial frequency source Y .
-When F207=7, target frequency is max value of main frequency source $X$ and accessorial frequency source Y.
-When $\mathrm{F} 207=7$, target frequency is min value of main frequency source X and accessorial frequency source Y.

## Note:

1. When $\mathrm{F} 203=4$ and $\mathrm{F} 204=1$, the difference between $\mathrm{F} 207=1$ and $\mathrm{F} 207=4$ is that when $\mathrm{F} 207=1$, frequency source selecting is the addition of stage speed and analog, when $F 207=4$, frequency source selecting is stage speed with stage speed and analog given at the same time. If stage speed given is canceled and analog given still exists, inverter will run by analog given.
2. Frequency given mode can be switched over by selecting F207. For example: switching PID adjusting and normal speed control, switching stage speed and analog given, switching PID adjusting and analog given, and so on.
3. The acceleration/deceleration time of stage speed is set by function code of corresponding stage speed time.
4. The mode of automatic cycle speed control is unable to combine with other modes.
5. When $\mathrm{F} 207=2$ (main frequency source and accessorial frequency source can be switched over by terminals), if main frequency is not set to be under stage-speed control, accessorial frequency can be set to be under automatic cycle speed control (F204=5, F500=0). Through the defined switchover terminal, the control mode (defined by X ) and automatic cycle speed control (defined by Y ) can be freely switched.
6. When $\mathrm{F} 207=6$, $\mathrm{F} 205=0$ and $\mathrm{F} 206=100$, $\mathrm{X}+\mathrm{Y}-\mathrm{Y}_{\mathrm{MAX}} * 50 \%=\mathrm{X}+\mathrm{Y}-\mathrm{F} 111 * 50 \%$, and if $\mathrm{F} 207=6$, $\mathrm{F} 205=1$ and $\mathrm{F} 206=100$, then $\mathrm{X}+\mathrm{Y}-\mathrm{Y}_{\mathrm{MAX}} * 50 \%=\mathrm{X}+\mathrm{Y}-\mathrm{X} * 50 \%$.

| F208 | Setting range: |  |
| :--- | :--- | :--- |
| Terminal <br> two-line/three-line function | 1: Two-line operation mode 1; | Mfr's value: 0 |

| operation control | 2: Two-line operation mode 2; |  |
| :--- | :--- | :--- |
|  | 3: three-line operation mode $1 ;$ |  |
|  | 4: three-line operation mode 2; |  |
|  | 5: start/stop controlled by direction pulse |  |

- When selecting two-line type or three-line type), F200, F201 and F202 are invalid.
- Five modes are available for terminal operation control.

Note: "FWD", "REV" and "X" are three terminals designated in programming DI1~DI8.
1: Two-line mode 1: this mode is the most popularly used two-line mode. The running direction of mode is controlled by FWD, REV terminals.

For example: "FWD" terminal-----"open": stop, "closed": forward running;
"REV" terminal-----"open": stop, "closed": reverse running; ${ }^{\circ}$
"CM" terminal-----common port

| K1 | K2 | Running command |
| :---: | :---: | :---: |
| 0 | 0 | Stop |
| 1 | 0 | Forward running |
| 0 | 1 | Reverse running |
| 1 | 1 | Stop |

2. Two-line mode 2: when this mode is used, FWD is enable terminal, the direction is controlled by REV terminal.

For example: "FWD" terminal-----"open": stop, "closed": running;
"REV" terminal-----"open": forward running,
"closed": reverse running;
"CM" terminal-----common port

| K1 | K2 | Running command |
| :---: | :---: | :---: |
| 0 | 0 | Stop |
| 0 | 1 | Stop |
| 1 | 0 | Forward running |
| 1 | 1 | Reverse running |

3. Three-line mode 1 :

In this mode, X terminal is enable terminal, the direction is controlled by FWD terminal and REV terminal. Pulse signal is valid.

Stopping commands is enabled by opening X terminal.

## SB3: Stop button

## SB2: Forward button.

## SB1: Reverse button.

## 4. Three-line mode 2 :

In this mode, X terminal is enable terminal, running command is controlled by FWD terminal. The running direction is controlled by REV terminal, and stopping command enable by opening X terminal.

## SB1: Running button

## SB2: Stop button

## K1: direction switch. Open stands for forward running; close stands for reverse running.

5. Start/stop controlled by direction pulse:
"FWD" terminal-(impulse signal: forward/stop)
"REV" terminal-(impulse signal: reverse/stop)
"CM" terminal-common port
Note: when pulse of SB1 triggers, inverter will run forward. Wher the pulse triggers again, inverter will stop running.

When pulse of SB2 triggers, inverter will run reverse. When the pulse triggers again, inverter will stop running.

| F209 | Selecting the mode of stopping <br> the motor | Setting range: <br> 0: stop by deceleration time; 1: free stop <br> 2: Stop by DC braking | Mfr's value: 0 |
| :--- | :--- | :--- | :--- |

When the stop signal is input, stopping mode is set by this function code:
F209=0: stop by deceleration time
Inverter will decrease output frequency according to setting acceleration/deceleration curve and decelerating time, after frequency decreases to 0 , inverter will stop. This is often common stopping type. During the process of speed track, this function is invalid. And inverter will be forced to stop during this process.
F209=1: free stop
After stop command is valid, inverter will stop output. Motor will free stop by mechanical inertia.
When F209=2, after inverter receives stop command, inverter will stop from present frequency by DC braking. Please set F656, F603 and F605 correctly to avoid error.

| F210 Frequency display accuracy | Setting range: $0.01 \sim 10.00$ | Mfr's value: 0.01 |
| :--- | :--- | :--- |

When inverter is in the running status, under keypad speed control, frequency display accuracy is set by F210 and the range is from 0.01 to 2.00 . For example, when $\mathrm{F} 210=0.5, \mathbf{\Delta} / \boldsymbol{\nabla}$ terminal is pressed at one time, frequency will increase or decrease by 0.5 Hz .
This function is valid when inverter is in the running state.

| F211 Speed of digital control (Hz/S) | Setting range: $0.01 \sim 100.0$ | Mfr's value: 5.00 |
| :--- | :--- | :--- |

When UP/DOWN terminal is pressed, frequency will change at the setting rate. The Mfr's value is
$5.00 \mathrm{~Hz} / \mathrm{s}$.

| F212 Direction memory | Setting range: 0: Invalid 1: Valid | Mfr's value: 0 |
| :--- | :--- | :--- |

- This function is valid when three-line operation mode 1(F208=3) is valid.
- When F212=0, after inverter is stopped, resetted and repowered on, the running direction is not memorized.
- When F212=1, after inverter is stopped, resetted and repowered on, if inverter starts running but no direction signal, inverter will run according the memory direction.

| F213 Auto-starting after repowered on | Setting range: 0: invalid; 1: valid | Mfr's value: 0 |
| :--- | :--- | :--- |
| F214 Auto-starting after reset | Setting range: 0 : invalid; 1: valid | Mfr's value: 0 |

Whether or not to start automatically after repowered on is set by F213
F213=1, Auto-starting after repowered on is valid. When inverter is power off and then powered on again, it will run automatically after the time set by F215 and according to the running mode before power-down. If F220 $=0$ frequency memory after power-down is not valid, inverter will run by the setting value of F113.
F213 $=0$, after repower-on, inverter will not run automatically unless running command is given to inverter.
-Whether or not to start automatically after fault resetting is set by F214
When F214=1, if fault occurs, inverter will reset automatically after delay time for fault reset (F217). After resetting, inverter will run automatically after the auto-starting delay time (F215).
If frequency memory after power-down (F220) is valid, inverter will run at the speed before power-down. Otherwise, inverter will run at the speed set by F113.
In case of fault under running status, inverter will reset automatically and auto-start. In case of fault under stopped status, the inverter will only reset automatically.
When F214=0, after fault occurs, inverter will display fault code, it must be reset by manually.

| F215 | Auto-starting delay time (S) | Setting range: $0.1 \sim 3000$ |
| :--- | :--- | :--- |

F215 is the auto-starting delay time for F213 and F214. The range is from 0.1s to 3000.0s.

| F216 | Times of auto-starting in case of <br> repeated faults | Setting range: $0 \sim 5$ | Mfr's value: 0 |
| :--- | :--- | :--- | :--- |
| F217 | Delay time for fault reset | Setting range: $0.0 \sim 3000.0$ | Mfr's value: 3.0 |
| F219 | EEPROM write operation | Setting range:0:enabled to write <br> 1:prohibit writing | Mfr's value: 1 |

F216 sets the most times of auto-starting in case of repeated faults. If starting times are more than the setting value of this function code, inverter will not reset or start automatically after fault. Inverter will run after running command is given to inverter manually.
F217 sets delay time for fault reset. The range is from 0.0 to 10.0 S which is time interval from fault to resetting.
When F219=1 (address 2001 H is not operated by PC/PLC), the function code is modified by communication, and it is not saved in the EEPROM. It means there is no memory when power down. When F219=0 ((address 2001 H is not operated by PC/PLC), the function code is modified by communication, and it is saved in the EEPORM. It means there is memory when power down.

| F220 | Frequency memory after power-down | Setting range: 0 : invalid; $1:$ valid | Mfr's value: 0 |
| :--- | :--- | :--- | :--- |

F220 sets whether or not frequency memory after power-down is valid.

This function is valid for F213 and F214. Whether or not to memory running state after power-down or malfunction is set by this function.
-The function of frequency memory after power-down is valid for main frequency and accessorial frequency that is given by digital. Because the digital given accessorial frequency has positive polarity and negative polarity, it is saved in the function codes F155 and F156.

| F221 $\quad$ X+Y-50\%(\%) | Setting range: $0 \sim 200$ | Mfr's value: 50 |
| :--- | :--- | :--- |
| F222 $\quad$ countmemory selection | Setting range: 0: Invalid 1: Valid | Mfr's value: 0 |

-F220 sets whether or not count memory is valid. Whether or not to memory counting values after power-down or malfunction is set by this function.

| F223 | Main frequency coefficient | Setting range: $0.0 \sim 100.0$ | Mfr's value: 100.0 |
| :--- | :--- | :--- | :--- |

Target frequency=main frequency*main frequency coefficient.

| F224 when target frequency is <br> lower than Min frequency | Setting range: <br> 0 : stop 1: run at min frequency | Mfr's value: 0 |
| :--- | :--- | :--- |

- F224=0, when target frequency is lower than Min frequency, inverter will stop.
- F224=1, when target frequency is lower than Min frequency, inverter will run at Min frequency.

Table 6-1
Combination of Speed Control

|  | 0. Memory of digital setting | $\begin{aligned} & \hline 1 \text { External } \\ & \text { analog } \\ & \text { AI1 } \\ & \hline \end{aligned}$ | 2 External analog AI2 | 3Pulse input given | $\begin{array}{\|l\|} \hline 4 \text { Terminal } \\ \text { stage speed } \\ \text { control } \end{array}$ | $\begin{aligned} & 5 \text { PID } \\ & \text { adjusting } \end{aligned}$ | 6 Analog AI3 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\begin{array}{\|l\|} \hline 0 \text { Memory of } \\ \text { Digital setting } \\ \hline \end{array}$ | $\bigcirc$ | - | $\bullet$ | - | $\bullet$ | $\bullet$ | $\bullet$ |
| 1External analog AI1 | $\bullet$ | $\bigcirc$ | $\bullet$ | $\bullet$ | $\bullet$ | $\bullet$ | $\bullet$ |
| 2External analog AI2 | $\bullet$ | - | $\bigcirc$ | $\bullet$ | $\bullet$ | $\bullet$ | $\bullet$ |
| 3 Pulse input given | $\bullet$ | $\bullet$ | $\bullet$ | $\bigcirc$ | $\bullet$ | $\bullet$ | $\bullet$ |
| 4Terminal Stage speed control | $\bullet$ | $\bullet$ | - | $\bullet$ | $\bigcirc$ | - | - |

| 9 PID adjusting | - | - | $\bullet$ | $\bullet$ | - | $\bigcirc$ | - |
| 10 MODBUS | $\bullet$ | $\bullet$ | $\bullet$ | $\bullet$ | $\bullet$ | $\bullet$ | $\bullet$ |

$\bullet$ : Inter-combination is allowable.
O: Combination is not allowable.
The mode of automatic cycle speed control is unable to combine with other modes. If the combination
includes the mode of automatic cycle speed control, only main speed control mode will be valid.

|  | S226Setting range: <br> Frequency | of skipping <br> 0 : no action during accel/decel <br> $1:$ no action during decelerating <br> 2. valid at any time | Mfr's value: 0 |
| :--- | :--- | :--- | :--- |

- F226=0, inverter will not skip the F127/F129 during accelerating and decelerating. It works during running with stable speed.
F226=1, inverter will not skip F127/129 during decelerating. It only works during running with stable speed or acceleration.
- F226=2, it works at accelerating, decelerating and running with stable speed.

Please refer to F127~F130 for other function codes.
Note: the frequency skipping width should not be too large during decelerating.

| F233 Accel/decel time unit | Setting range: $0: 0.1 \mathrm{~s} ; 1: 0.01 \mathrm{~s} ;$ | Mfr's value: 0 |
| :--- | :--- | :--- |

-When F233 $=0$, the accuracy of F114~F117 and stage speed is 0.1 s ;
-When F233 $=1$, the accuracy of F114~F117and stage speed is 0.01 s ;

| F234 switchover frequency during | Setting range: | Mfr's value: 0.00 |
| :---: | :--- | :--- |
| deceleration process $(\mathrm{Hz})$ | 0.00 : invalid $0.00 \sim$ F111 |  |

When F234 $=0$, this function is invalid.
When F234 $\neq 0$, if the running frequency is higher than F234, the decelerating time is normal. If the running frequency is lower than F234, the decelerating time is the $2^{\text {nd }}$ decelerating time(F117).
Note: this function code is only for special function of washing machine.

## Traverse Operating function

Traverse operation is widely used in textile and chemical fiber industry.

|  |  | $0:$ Invalid <br> F235 | Traverse operating mode |
| :--- | :--- | :--- | :--- | | 1: Traverse operating mode 1 |
| :--- |
| 2: Traverse operating mode 2 |
| $3:$ Traverse operating mode 3 |$\quad$ Mfr's value: 0 $\quad$.

$\cdot F 235=0$, this function is invalid.
$\cdot F 235=1$, traverse operating mode 1, the central frequency is set by F242, and the working process is shown in Fig 6-6.
$\cdot \mathrm{F} 235=2$, traverse operating mode 2 , the central frequency is on the decrease, the working process is shown in Fig 6-7.
$\cdot F 235=3$, traverse operating mode 3, the central frequency is set by F203. Under this mode, if the central frequency set by F203 is lower than the lower limit of central frequency, inverter will not stop running. In the other traverse operating mode, the value of central frequency is controlled by F243.

Fig 6-6

Fig 6-7

| F236 | Crawl-positioning | 0: Disabled 1: Enabled | Mfr's value: 0 |
| :--- | :--- | :--- | :---: |

Crawl-positioning mode: when this mode is enabled, if inverter gets the signal of stop, full of yarn, broken of yarn, fixed length control, inverter will run to the frequency of crawl-positioning (F252). After the waiting time of crawl-positioning (F253), if inverter gets a positioning stop signal, inverter will stop (the positioning stop signal is invalid within crawl-positioning waiting time). If there is no positioning stop signal, inverter will stop automatically after max time of crawl-positioning time (F524). Note: if F524=0, inverter will not stop automatically.

-When F237 $=0$ and $\mathrm{F} 235 \neq 0$, inverter will run by traverse mode.
-When F237=1 and F235 $\neq 0$, user should set DIX terminal as traverse start terminal, when this terminal is valid, traverse function is valid.

| F238 | Stop mode of <br> length arrival | 0: Stop the motor at fixed length <br> 1: Stop the motor at fixed spindle radius <br> 2: Non-stop at fixed length, it indicates full of yarn. <br> 3: Fixed radius arrival, it indicates full of yarn. | Mfr's value: 0 |
| :--- | :--- | :--- | :--- |
| F239 | Traverse memory <br> mode | 0: Memory at the status of stop and power off <br> 1: Only memory at the status of stop. <br> 2: Only memory at the status of power off. <br> 3: No memory. | Mfr's value: 0 |

F238 $=0$ or 1, when fixed length or fixed radius is arrival, inverter will stop.
$\mathrm{F} 238=2$ or 3, when fixed length or fixed radius is arrival, multifunction terminals (DO1, DO2 and relay output terminal) will output signal. Inverter will not stop, and "ovEr" will be displayed in the panel.

| F240 | Preset frequency (Hz) | F112~F111 | Mfr's value: 5.00 |
| :--- | :--- | :---: | :---: |
| F241 | Running time of preset frequency (S) | $0 \sim 3000$ | Mfr's value: 0 |

F240 is used to define the inverter's operating frequency before entering traverse mode.

F241 is used to define the time when the inverter operates at pre-traverse frequency.

| F242 | Central frequency (Hz) | F243~F111 | Mfr's value: 25.00 |
| :--- | :--- | :---: | :---: |
| F243 | Lower limit of central frequency <br> (Hz) | F112~F242 | Mfr's value: 0.50 |
| F244 | Descending rate of central <br> frequency (Hz / S) | $0.100 \sim 65.000$ | Mfr's value: 0.500 |
| F247 | Traverse amplitude setting mode | $0:$ Relative to max frequency <br> 1: Relative to central frequency | Mfr's value: 1 |
| F248 | Traverse amplitude (\%) | $0.00 \sim 100.00$ | Mfr's value: 10.0 |
| F249 | Jump frequency (\%) | $0.00 \sim 50.00$ | Mfr's value: 30.00 |
| F250 | Rising time of traverse (S) | $0.1 \sim 3000$ | Mfr's value: 10.0 |
| F251 | Descending time of traverse (S) | $0.1 \sim 3000$ | Mfr's value: 10.0 |
| F252 | Crawl-positioning frequency (Hz) | F112~F111 | Mfr's value: 3.00 |
| F253 | Waiting time of crawl-positioning (S) | $0.0 \sim 3000$ | Mfr's value: 5.0 |
| F254 | Max time of crawl-positioning (S) | $0.0 \sim 3000$ | Mfr's value: 10.0 |

Please refer to Fig 6-6, 6-7 and 6-8.
If the lower limit frequency of traverse amplitude is lower than min frequency F112, then the lower limit of frequency of traverse amplitude turns to min frequency of inverter. If the upper limit frequency of traverse amplitude is higher than the max frequency F111, the frequency of traverse amplitude will turn to max frequency of inverter.
Jitter frequency is the percent of traverse amplitude, which is set by F249.

| F257 | Cumulative length $(\mathrm{Km})$ | $0.0 \sim 6500.0$ | Mfr's value: 0.0 |
| :---: | :--- | :---: | :---: |
| F258 | Actual length $(\mathrm{Km})$ | $0.000 \sim 65.000$ | Mfr's value: 0.000 |
| F259 | Setting length $(\mathrm{Km})$ | $0.000 \sim 65.000$ | Mfr's value: 0.000 |
| F260 | Pulse numbers of length sensor | $0.01 \sim 650.0$ | Mfr's value: 1.00 |

In fixed length control mode, the function of F257~F260 is valid.

| F262 | Clear yarn broken signal | Setting range: <br> 0: stop and refer to yarn broken signal <br> 1: refer to yarn broken signal | Mfr's value: 0 |
| :--- | :--- | :--- | :--- |

When $\mathrm{F} 262=0$, after inverter stops, if there is no yarn broken signal, then clear yarn broken malfunction.
When $\mathrm{F} 262=1$, if there is no yarn broken signal, then clear yarn broken malfunction.

| F264 | Feedback channel of fixed radius | $0:$ AI1 1: AI2 | Mfr's value: 0 |
| :---: | :--- | :---: | :---: |
| F265 | Fixed-radius display value | $0 \sim 10000$ | Mfr's value: 1000 |
| F266 | Output voltage at fixed radius mode (V) | $0.00 \sim 10.00$ | Mfr's value: 5.00 |
| F267 | Voltage hysteresis when judging full of <br> yarn signal is clear. | $0.00 \sim 10.00$ | Mfr's value: 0.00 |

-F265 is used to set the display value corresponding to analog max value.
-F266 is used to set output voltage of fixed radius sensor when fixed radius is arrival.

- Voltage hysteresis is set by F267. For example: if F266=5.00, F267=0.30, only when the feedback voltage is lower than 4.70 V , inverter will judge full of yarn signal clear.

| F269 | DI pre-alarm current | Read only | Mfr's value: read only |
| :--- | :--- | :--- | :--- |
| F270 | DI pre-alarm current threshold (A) | $0.01 \sim 6.00$ | Mfr's value: 0.50 |
| F271 | DI pre-alarm current delay time (S) | $5 \sim 60$ | Mfr's value: 30 |

- When the function of DI pre-alarm is valid, running current will be saved in F269, Which is pre-alarm current value and not be changed. If DI terminal is enabled again, and running current is higher than (DI pre-alarm current + DI pre-alarm current threshold), after delay time of F271, DO terminal will output pre-alarm signal, but inverter will not stop. When running current is lower than (DI pre-alarm current + DI pre-alarm current threshold), DO terminal will not output pre-alarm signal.
Note: when DI terminal is invalid or not in running state, this function is invalid.

| F272 | Delay time of broken yarn and intertwining yarn (S) | $0.0 \sim 3000$ | 0.0 |
| :--- | :--- | :--- | :--- |

-The delay time after judging broken of yarn and intertwining yarn.
-when broken of yarn, BRK1 is displayed. When full of yarn, BRK2 is displayed.

| F275 | Detect frequency value (Hz) | F112~F111 | 25.00 |
| :---: | :--- | :---: | :---: |
| F276 | Detect frequency width (Hz) | $0.00 \sim 20.00$ | 0.50 |
| F277 | Third Acceleration Time (S) |  | Subjectto <br> inverter <br> model |
| F278 | Third Deceleration Time (S) | $0.1-3000$ |  |
| F279 | Fourth Acceleration Time (S) |  |  |
| F280 | Fourth Deceleration Time (S) |  |  |

-When inverter runs to diction frequency set by F275, the multifunction terminal will output a signal.

### 6.3. Multifunctional Input and Output Terminals

### 6.3.1 Digital multifunctional output terminals

| F300 | Relay token output | Setting range: $0 \sim 59$ | Mfr's value: 1 |
| :--- | :--- | :--- | :--- |
| F301 | DO1 token output | Refer to table 6-2 for detailed instructions. | Mfr's value: 14 |
| F302 | DO2 token output |  | Mfr's value: 5 |

E2000 inverter has one multifunctional relay output terminal. Inverters of 30 kW and below 30 kW have one multifunctional digital output terminals (without DO2 terminal), inverters above 30 kW have two multifunctional digital output terminals.
In water supply system, if the fixed mode or timing interchanging mode is selected, relay token output and DO1 token output is invalid.

Table 6-2 Instructions for digital multifunctional output terminal

| Value | Function | Instructions |
| :---: | :---: | :---: |
| 0 | no function | Output terminal has no functions. |
| 1 | inverter fault protection | When inverter works wrong, ON signal is output. |
| 2 | over latent frequency 1 | Please refer to instructions from F307 to F309. |
| 3 | over latent frequency 2 | Please refer to instructions from F307 to F309. |
| 4 | free stop | Under free stop status, after stop command is given, ON signal is output until inverter completely stops. |
| 5 | In running status 1 | Indicating that inverter is running and ON signal is output. |
| 6 | Reserved | Reserved |
| 7 | acceleration/deceleration time switchover | Indicating that inverter is in the status of acceleration/deceleration time switchover |
| 8 | Reaching the Set Count Value | This terminal will be "action" when inverter carries the external count instruction and count value reaches the set value of F314. |
| 9 | Reaching the Designated Count Value | This terminal will be "action" when inverter carries the external count instruction and count value reaches the set value of F315. |
| 10 | inverter overload pre-alarm | When inverter is in over current status, if the accumulation time is more than inverter's overload protection time * F704, inverter outputs ON signal. After over current disappears or OL1 is enable, the signal output will stop. |
| 11 | motor overload pre-alarm | When motor is in over current status, if the accumulation time is more than motor's overload protection time * F705, inverter outputs ON signal. After over current disappears or OL2 is enable, the signal output will stop. |
| 13 | Inverter is ready to run | When inverter is powered on. Protection function is not in action and inverter is ready to run, then ON signal is output. |
| 14 | In running status 2 | Indicating that inverter is running and ON signal is output. When inverter is running at 0 HZ , it seems as the running status, and ON signal is output. |
| 15 | frequency arrival output | Indicating inverter runs to the setting target frequency, and ON signal is output. See F312. |
| 16 | overheat pre-alarm | When testing temperature reaches $80 \%$ of setting value, ON signal is output. When overheat protection occurs or testing value is lower than $80 \%$ of setting value, ON signal stops outputting. |

| 17 | over latent current output | When output current of inverter reaches the setting overlatent current, ON signal is output. See F310 and F311. |  |
| :---: | :---: | :---: | :---: |
| 18 | Analog line disconnection protection | Indicating inverter detects analog input lines disconnection, and ON signal is output. Please refer to F741. |  |
| 19 | Under-load 1 pre-alarm | Please refer to FA26 and FA27. |  |
| 20 | Zero current detecting output | When inverter output current has fallen to zero current detecting value, and after the setting time of F 755 , ON signal is output. Please refer to F754 and F755. |  |
| 21 | Output controlled by communication address 2005H | 1 means output is valid. 0 means output is invalid. |  |
| 22 | Output controlled by communication address 2006H |  |  |
| 23 | Output controlled by communication address 2007H |  |  |
| 24 | Watchdog output token | Output signal is valid when inverter trips into Err6. |  |
| 25 | DI Pre-alarm current | Indicating pre-alarm states of running current higher than pre-alarm current (F269+F270) |  |
| 26 | Communication reset | When faults occur, inverter will be reset by Modbus writing 9 to $0 \times 2000$. |  |
| 28 | Dormancy | When inverter enters into dormancy status, ON signal output. |  |
| 30 | General pump is running | Indicating some general pumps are running. |  |
| 31 | Converter pump is running | Indicating some converter pumps are running. |  |
| 32 | Over-limit pressure token | Indicating the max limit value when PID adjusting is valid and negative feedback is selected, and feedback pressure is higher than max pressure set by F503 |  |
| 35 | Stop signal of yarn full, yarn broken, yarn intertwining and stop inverter by manual | Indicating stop signal of yarn full, yarn broken, yarn intertwining and stop inverter by manual |  |
| 36 | Full yarn signal | Indicating yarn is full. |  |
| 37 | Output signal of traverse rising | Indicating traverse is rising. |  |
| 38 | Traverse wave form output | Indicating inverter is in the traverse status. |  |
| 39 | Yarn frequency detected | This function is valid when it is higher than yarn frequency, or else it is invalid. |  |
| 42 | The second motor token output | Indicating the current motor is the second motor. |  |
| 43 | Communication timeout 2 | When F907>0, and receiving the previous data, if after the time set by F907, the next data is not received, inverter will output communication timeout signal. The timeout signal will be cleared by this terminal, and after receiving correct data, inverter will accumulate time again. |  |
| 45 | Token output when lower than setting temperature | When temperature is lower or equal to $0^{\circ} \mathrm{C}$, token output signal is valid. When temperature is higher than $0^{\circ} \mathrm{C}+2^{\circ} \mathrm{C}$, token output is invalid. |  |
| 55 | Under load | When FA77=2 or 3, when inverter is in the process of under load, ON signal is output. |  |
| 59 | oPEn | When drive trips into oPEn, the terminal is valid. |  |
| F303 DO output types selection ${ }^{\text {S }}$ |  | Setting range: 0 : level output 1 : pulse output | Mfr's value: 0 |

- When level output is selected, all terminal functions in table 6-2 can be defined by F301.
- When pulse output is selected, DO1 can be defined as high-speed pulse output terminal. The max pulse frequency is 100 KHz . The related function codes are F449, F450, F451, F452, F453.

| F304 | S curve beginning stage proportion (\%) | Setting range: $2.0 \sim 50.0$ | 30.0 |
| :--- | :--- | :--- | :--- |
| F305 | S curve ending stage proportion (\%) | Setting range: $2.0 \sim 50.0$ | 30.0 |
| F306 | Accel/decel mode | Setting range: $0:$ Straight-line <br> 1: S curve | 0 |

Please refer to Fig 5-9 about S curve accel/decel:

Fig 6-9 S curve acceleration /deceleration
T 1 is the acceleration time from present frequency to target frequency.
T2 is the deceleration time from present frequency to target frequency.
During the acceleration process, in the (1) stage, the acceleration slope is bigger gradually, in the (2) stage, the acceleration slope is constant, in the (3) stage, the acceleration slope is weaker gradually.

| F307 Characteristic frequency $1(\mathrm{~Hz})$ | Setting range: F112~F111 | Mfr's value: 10 |
| :--- | :--- | :--- |
| F308 Characteristic frequency $2(\mathrm{~Hz})$ |  | Mfr's value: 50 |
| F309 Characteristic frequency width $(\%)$ | Setting range: $0 \sim 100$ | Mfr's value: 50 |

When $\mathrm{F} 300=2,3, \mathrm{~F} 301=2,3$ and $\mathrm{F} 302=2,3$ and token characteristic frequency is selected, this group function codes set characteristic frequency and its width. For example: setting F301=2, F307=10, F309=10, when frequency is higher than F307, DO1 outputs ON signal. When frequency is lower than $(10-10 * 10 \%$ ) $=9 \mathrm{~Hz}$, DO1 outputs OFF signal.

| F310 Characteristic current (A) | Setting range: $0 \sim 5000.0$ | Mfr's value: Rated current |
| :--- | :--- | :--- |
| F311 $\quad$ Characteristic current width (\%) | Setting range: $0 \sim 100$ | Mfr's value: 10 |

When F300=17 and F301=17 and F302=17 and token characteristic current is selected, this group function codes set characteristic current and its width.
For example: setting $\mathrm{F} 301=17, \mathrm{~F} 310=100$, $\mathrm{F} 311=10$, when inverter current is higher than F 310 , DO1 outputs ON signal. When inverter current is lower than $(100-100 * 10 \%)=90 \mathrm{~A}$, DO1 outputs OFF signal.

| F312 Frequency arrival threshold (Hz) | Setting range: $0.00 \sim 5.00$ | Mfr's value: 0.00 |
| :--- | :--- | :--- |

When $F 300=15$ and $F 301=15$, threshold range is set by F312.
For example: when $\mathrm{F} 301=15$, target frequency is 20 HZ and $\mathrm{F} 312=2$, the running frequency reaches $20.00 \pm 2.00 \mathrm{~Hz}, \mathrm{ON}$ signal is output by DO1.

| F313 Count frequency divisions | Setting range: $1 \sim 65000$ | Mfr's value: 1 |
| :--- | :--- | :--- |
| F314 Set count value | Setting range: $\mathrm{F} 315 \sim 65000$ | Mfr's value: 1000 |
| F315 Designated count value | Setting range: $1 \sim$ F314 | Mfr's value $: 500$ |

Count frequency divisions refer to the ratio of actual pulse input and inverter's count times, i.e.,

$$
\text { Inverter's Count Times }=\frac{\text { Actual Pulse Input }}{\text { Count Frequency Division }}
$$

e.g. when $\mathrm{F} 313=3$, inverter will count once for every 3 inputs of external pulse.
-Set count values refer to a count width pulse output by the output terminal (DO1 terminal or relay) programmed with "reaching the set count values" function when a certain number of pulses are input from DI1. Count will restart after the count value reaches "set times".
As shown in Fig 6-10: if $\mathrm{F} 313=1, \mathrm{~F} 314=8$, F301 $=8$, DO1 will output an instruction signal when DI1 inputs the $8^{\text {th }}$ pulse.

- Designated count values refer to an pulse output by the output terminal (DO1 or RELAY terminal) programmed with "reaching the set count values" function when a certain number of pulses are input from DI1, until count value reaches the "set times".
As shown in Fig 6-10: if $\mathrm{F} 313=1, \mathrm{~F} 314=8, \mathrm{~F} 315=5, \mathrm{~F} 300=9$, relay will output an instruction signal when DI1 inputs the $5^{\text {th }}$ pulse, relay will output an instruction signal until reaching "set count times 8 ".

Fig 6-10 Set Count times \& Designated Count Times

### 6.3.2 Digital multifunctional input terminals

- This parameter is used for setting the corresponding function for multifunctional digital input terminal.
-Both free stop and external emergency stop of the terminal have the highest priority.
-When pulse given is selected, DIl terminal is set as pulse signal input terminal automatically.
Note: $\mathbf{3 0} \mathrm{kW}$ inverter and below 22 kW has 6 multifunctional digital input terminals DI1~DI6.
Table 6-3 Instructions for digital multifunctional input terminal

| Value | Function | Instructions |  |
| :---: | :---: | :--- | :---: |
| 0 | No function | Even if signal is input, inverter will not work. This function can be <br> set by undefined terminal to prevent mistake action. |  |
| 1 | Running terminal | When running command is given by terminal or terminals <br> combination and this terminal is valid, inverter will run. This <br> terminal has the same function with "run" key in keypad. |  |
| 2 | Stop terminal | When stop command is given by terminal or terminals combination <br> and this terminal is valid, inverter will stop. This terminal has the <br> same function with "stop" key in keypad. |  |
| 3 | Multistage speed terminal 1 | 15-stage speed is realized by combination of this group of |  |
| 4 | Multistage speed terminal 2 | terminals. See table 5-6. |  |

| 9 | External emergency stop terminal | When external malfunction signal is given to inverter, malfunction will occur and inverter will stop. |
| :---: | :---: | :---: |
| 10 | Acceleration/deceleration forbidden terminal | Inverter will not be controlled by external signal (except for stop command), and it will run at the current output frequency. |
| 11 | forward run jogging | Forward jogging running and reverse jogging running. Refer to F124, F125 and F126 for jogging running frequency, jogging acceleration/deceleration time. |
| 12 | reverse run jogging |  |
| 13 | UP frequency increasing terminal | When frequency source is set by digital given, the setting frequency can be adjusted which rate is set by F211. |
| 14 | DOWN frequency decreasing terminal |  |
| 15 | "FWD" terminal | When start/stop command is given by terminal or terminals combination, running direction of inverter is controlled by external terminals. |
| 16 | "REV" terminal |  |
| 17 | Three-line input " $X$ " terminal | "FWD", "REV", "CM" terminals realize three-line control. See F208 for details. |
| 18 | acceleration/deceleration time switchover 1 | Please refer to Table 5-4. |
| 19 | Reserved | Reserved |
| 20 | Reserved | Reserved |
| 21 | frequency source switchover terminal | When $\mathrm{F} 207=2$, main frequency source and accessorial frequency source can be switched over by frequency source switching terminal. When $\mathrm{F} 207=3$, X and $(\mathrm{X}+\mathrm{Y})$ can be switched over by frequency source switching terminal. |
| 22 | Count input terminal | Built-in count pulse input terminal. <br> Note: when PID source is pulse input, please set F316 to 22. |
| 23 | Count reset terminal | Reset terminal count value to zero. |
| 24 | clear traverse status | When this terminal is valid, traverse status will be cleared in the stop status. After inverter runs again, the traverse process will be repeated again. |
| 25 | Traverse operating mode is valid | When $\mathrm{F} 235 \neq 0$ and $\mathrm{F} 237=1$, this terminal is used to control start/stop of traverse operating mode. If inverter is in the running status and this terminal is valid, traverse operating mode starts. |
| 26 | yarn broken | In the mode of traverse operating, if this terminal is valid, inverter will stop. If crawl-positioning function is valid, inverter will run to crawling frequency, and positioning, inverter will stop. When this terminal is invalid, inverter will run normally. |
| 27 | intertwining yarn |  |
| 28 | crawl-positioning signal | During the process of crawl-positioning and after the waiting time F253, if the terminal is valid, inverter will stop. |
| 29 | clear actual yarn length and traverse status | This terminal is used to clear actual yarn length and traverse status. |
| 30 | Water lack signal | When PID control is valid and FA26=1, this function is valid. While lack of water, inverter will be in the protection state. |
| 31 | Signal of water | When PID control is valid and FA26=1, this function is valid. If water is enough, inverter will reset automatically. |
| 32 | Fire pressure switchover | When PID control is valid and this terminal is valid, the setting value of PID switches into fire pressure given (FA58). |
| 33 | Emergency fire control | When emergency fire mode (FA59) is valid, inverter will be in emergency fire mode. |

| 34 | Acceleration / deceleration <br> switchover 2 | Please refer to Table 5-4. |
| :---: | :---: | :--- |
| 37 | Common-open PTC heat <br> protection | When this function is valid, common-open heat relay is externally <br> connected. When common-open contact is closed and inverter is <br> in the running status, inverter will trip into OH1. |
| 38 | Common-close PTC heat <br> protection | When this function is valid, common-close heat relay is <br> externally connected. When common-close contact is open and <br> inverter is in the running status, inverter will trip into OH1. |
| 41 | DI pre-alarm current <br> enable | When this function is valid, inverter will test running current. |
| 49 | PID paused | PID adjustment is invalid temporarily. |
| 51 | Motor switchover | When FE00=2 and this function is valid, switching to the second <br> motor. |
| 53 | Watchdog | During the time set by F326 elapses without an impulse being <br> registered, inverter will trip into Err6, and inverter will stop <br> according to stop mode set by F327. |
| 54 | Frequency reset | If the function is valid, target frequency will change to the value <br> set by F113. |
| 60 | Communication timeout 2 | When F907>0, and receiving the previous data, if after the time <br> set by F907, the next data is not received, inverter will output <br> communication timeout signal. The timeout signal will be cleared <br> by this terminal, and after receiving correct data, inverter will <br> accumulate time again. |
| 61 | Start-stop terminal | When the function is invalid, it is stop terminal. When the <br> function is valid, it is start terminal. |

Fig 6-6 PTC heat protection

When the coding switch is in the end of "NPN", PTC resistor should be connected between CM and DIx terminal. When the coding switch is in the end of "PNP", PTC resistor should be connected between DIx and 24 V . The recommended resistor value is 16.5 K .
Because the precision of external PTC has some differences with optocoupler consistency, protection value precision will be bad, heat protection relay is suggested to be used.

Table 6-4 Accel/decel selection

| Accel/decel switchover <br> $2(34)$ | Accel/decel switchover <br> $1(18)$ | Present accel/decel time | Related parameters |
| :---: | :---: | :---: | :---: |

| 0 | 1 | 1 | 0 | Multi-stage speed 6 | F509/F524/F539/F554/F562/F570 |
| 0 | 1 | 1 | 1 | Multi-stage speed 7 | F510/F525/F540/F555/F563/F571 |
| 1 | 0 | 0 | 0 | Multi-stage speed 8 | F511/F526/F541/F556/F564/F572 |
| 1 | 0 | 0 | 1 | Multi-stage speed 9 | F512/F527/F542/F573 |
| 1 | 0 | 1 | 0 | Multi-stage speed 10 | F513/F528/F543/F574 |
| 1 | 0 | 1 | 1 | Multi-stage speed 11 | F514/F529/F544/F575 |
| 1 | 1 | 0 | 0 | Multi-stage speed 12 | F515/F530/F545/F576 |
| 1 | 1 | 0 | 1 | Multi-stage speed 13 | F516/F531/F546/F577 |
| 1 | 1 | 1 | 0 | Multi-stage speed 14 | F517/F532/F547/F578 |
| 1 | 1 | 1 | 1 | Multi-stage speed 15 | F518/F533/F548/F579 |

Note: 1. K4 is multi-stage speed terminal 4, K3 is multi-stage speed terminal 3, K2 is multi-stage speed terminal 2, K1 is multi-stage speed terminal 1 . And 0 stands for OFF, 1 stands for ON.
2. $0=\mathbf{O F F}, 1=\mathbf{O N}$
3. The setting of this table is valid when $F 580=0$.

| F324 Free stop terminal logic | Setting range: <br> 0: positive logic (valid for low level); <br> 1: negative logic (valid for high level) | Mfr's value: 0 |
| :--- | :--- | :--- |
| F325 | External emergency stop terminal logic value: 0 |  |
| F326 | Watchdog time | Setting range: 0.0 : Invalid <br> $0.1 \sim 30000$ |
| F327 | Stop mode | Setting range: <br> 0: Free to stop $\quad$ 1: Deceleration to stop |
| F328 Terminal filtering times | Setting range: $1 \sim 100$ | Mfr's value : 0 |

When multi-stage speed terminal is set to free stop terminal (8) and external emergency stop terminal (9), terminal logic level is set by this group of function codes. When $F 324=0$ and $F 325=0$, positive logic and low level is valid, when $\mathrm{F} 324=1$ and $\mathrm{F} 325=1$, negative logic and high level is valid.

| F329 Run command of start terminal | Setting range: $0:$ Valid 1: Invalid | Mfr's value: 0 |
| :--- | :--- | :--- |

When F329=0, after power on, if start terminals (running terminal, forward jogging, reverse jogging, FWD, REV, 3-line X input enable) is valid, inverter will start running directly.
When $\mathrm{F} 329=1$, after power on, if start terminals (running terminal, forward jogging, reverse jogging, FWD, REV, 3-line X input enable) is valid, inverter will start running after disconnect start terminal first and enable it again.

## Diagnostics and simulation functions

| F330 Diagnostics of DIX terminal |  | Read only |
| :--- | :--- | :--- |

F330 is used to display the diagnostics of DIX terminals.
Please refer to Fig 6-12 about the DIX terminals diagnostics in the first digitron.

Fig 6-12 Status of digital input terminal
The dotted line means this part of digitron is red.
For example, in the first digitron, the upper part of digitron is red, it means DI1 terminal is invalid. The lower part of digitron is red, it means DI2 is valid. The four digitrons stands for the status of DI1-DI8 terminals
Please refer to Fig 6-13 about four-line LCD interface. The solid-line box and dotted-line box indicate the invalid and valid respectively.

Figure 6-13 Status of digital input terminals

Set F645=22, press "SET", switch interface by "FUN" key to display 8 boxes. Short connecting to DI1~DI8, terminals are valid if number turns from 0 to 1 , and eight dotted-line boxes are displayed; Terminals are invalid if number does not turn to 1 , and eight solid-line boxes are displayed.
If user wants to see the detailed status for each terminal, set the function code as F330, press "SET" to enter diagnosis interface, which is showed below.

The first line indicates digital input，digital output；First eight boxes in the second line indicate the state of DI terminals，terminals from left to right are DI1～DI8，solid－line box is the state showed as above when terminal is invalid；Black box is displayed when terminal is valid．E．g．If all 8 terminals are valid， リ【】【 【will be displayed．
The last three boxes represent the terminal output status of DO1，DO2 and relay，which display mode is the same as DI terminals．E．g．If 3 terminals are valid at same time，$\square \square$ will be displayed．
The third line indicates the name of AI1，AI2 and AO1，AO2．The value displayed in fourth line correspond to the content of third line．

```
E.g. AI1 AI2 AO1 AO2
    2010 0000 000% 000%
```

It means the value of AI1 is 2010，so are the rest three values．
After checking diagnosis interface，if user needs to exit interface，press＂FUN＂key to enter first－level menu．

Analog input monitoring，the value of analog is displayed by $0 \sim 4095$ ．

| :--- | :--- | :--- |
| F332 Monitoring AI2 |  | Read only |
| F333 Monitoring AI3 |  | Read only |

Relay／Digital output simulation

| F335 | Relay output simulation | Setting range： | Mfr＇s value： 0 |
| :--- | :--- | :--- | :--- |
| F336 | DO1 output simulation | 0：Output active | Mfr＇s value： 0 |
| F337 | DO2 output simulation | 1：Output inactive． | Mfr＇s value： 0 |

Take an example of DO1 output simulation，when inverter is in the stop status and enter F336，press the UP key，the DO1 terminal is valid．Relax the UP key，DO1 remains valid status．After quitting F336，DO1 will revert to initial output status．
4．Analog output simulation

| F338 | AO1 output simulation | Setting range： $0 \sim 4095$ | Mfr＇s value： 0 |
| :--- | :--- | :--- | :--- |
| F339 | AO2 output simulation | Setting range： $0 \sim 4095$ | Mfr＇s value： 0 |

When inverter is in the stop status，and enter F338 or F339，press the UP key，the output analog will increase，and when press the DOWN key，the output analog will decrease．If relax the key，analog output remains stable．After quitting the parameters， AO 1 and AO 2 will revert to initial output status．

| F340 Selection of terminal | Setting range： |  | Mfr＇s value： 0 |
| :--- | :--- | :--- | :--- |
| negative logic | 0：Invalid | 1：DI1 negative logic |  |
|  | 2：DI2 negative logic | 4：DI3 negative logic |  |
|  | 8：DI4 negative logic | 16：DI5 negative logic |  |
|  | 32：DI6 negative logic | 64：DI6 negative logic |  |
|  | 128：DI8 negative logic |  |  |

For example：if user wants to set DI1 and DI4 to negative logic，please set F340＝1＋8＝9．

| F343 | Delay time of DI1 ON | Setting range: $0.00 \sim 99.99$ | Mfr's value: 0.00 |
| :---: | :---: | :--- | :--- |
| F344 | Delay time of DI2 ON | Setting range: $0.00 \sim 99.99$ | Mfr's value: 0.00 |
| F345 | Delay time of DI3 ON | Setting range: $0.00 \sim 99.99$ | Mfr's value: 0.00 |
| F346 | Delay time of DI4 ON | Setting range: $0.00 \sim 99.99$ | Mfr's value: 0.00 |
| F347 | Delay time of DI5 ON | Setting range: $0.00 \sim 99.99$ | Mfr's value: 0.00 |
| F348 | Delay time of DI6 ON | Setting range: $0.00 \sim 99.99$ | Mfr's value: 0.00 |
| F349 | Delay time of DI7 ON | Setting range: $0.00 \sim 99.99$ | Mfr's value: 0.00 |
| F350 | Delay time of DI8 ON | Setting range: $0.00 \sim 99.99$ | Mfr's value: 0.00 |
| F351 | Delay time of DI1 OFF | Setting range: $0.00 \sim 99.99$ | Mfr's value: 0.00 |
| F352 | Delay time of DI2 OFF | Setting range: $0.00 \sim 99.99$ | Mfr's value: 0.00 |
| F353 | Delay time of DI3 OFF | Setting range: $0.00 \sim 99.99$ | Mfr's value: 0.00 |
| F354 | Delay time of DI4 OFF | Setting range: $0.00 \sim 99.99$ | Mfr's value: 0.00 |
| F355 | Delay time of DI5 OFF | Setting range: $0.00 \sim 99.99$ | Mfr's value: 0.00 |
| F356 | Delay time of DI6 OFF | Setting range: $0.00 \sim 99.99$ | Mfr's value: 0.00 |
| F357 | Delay time of DI7 OFF | Setting range: $0.00 \sim 99.99$ | Mfr's value: 0.00 |
| F358 | Delay time of DI8 OFF | Setting range: $0.00 \sim 99.99$ | Mfr's value: 0.00 |

| F359 Stop command priority | Setting range: 0: Invalid 1: Valid | Mfr's value: 0 |
| :--- | :--- | :--- | :--- |

-When F359=1, if inverter get stop command when run command is valid, inverter will stop first. Inverter will start again only after disconnecting the start terminal first and connect it again.

|  | Setting range: 0 : Invalid <br> F360 | DO terminal negative logic | DO1 negative logic |
| :--- | :--- | :--- | :--- |
|  | 2: DO2 negative logic | Mfr's value: 0 |  |
|  | 4: Relay 1 |  |  |

$\cdot$ If DO1 is negative logic, $\mathrm{F} 360=1$. If DO 2 is negative logic, $\mathrm{F} 360=2$. If relay 1 is negative logic, $\mathrm{F} 360=4$. If DO1 and DO2 are negative logic, then $\mathrm{F} 360=1+2=3$..

### 6.4 Analog Input and Output

E2000 series inverters have 2 analog input channels and 2 analog output channels. AI3 input channel is inside input channel for potentiometer on the keypad panel.

| F400 | Lower limit of AI1 channel input (V) | Setting range: $0.00 \sim$ F402 | Mfr's value: 0.04 |
| :--- | :--- | :--- | :--- |
| F401 | Corresponding setting for lower limit of AI1 input | Setting range: $0 \sim 2.00$ | Mfr's value: 1.00 |
| F402 | Upper limit of AIl channel input (V) | Setting range: $\mathrm{F} 400 \sim 10.00$ | Mfr's value: 10.00 |
| F403 | Corresponding setting for upper limit of AI1 input | Setting range: $0.00 \sim 2.00$ | Mfr's value: 2.00 |
| F404 | AI1 channel proportional gain K1 | Setting range: $0.0 \sim 10.0$ | Mfr's value: 1.0 |
| F405 | AI1 filtering time constant (S) | Setting range: $0.10 \sim 10.00$ | Mfr's value: 0.10 |

$\cdot$ In the mode of analog speed control, sometimes it requires adjusting coincidence relation among upper limit and lower limit of input analog, analog changes and output frequency, to achieve a satisfactory speed control effect.

- Upper and lower limit of analog input are set by F400 and F402.

For example: when $\mathrm{F} 400=1, \mathrm{~F} 402=8$, if analog input voltage is lower than 1 V , system judges it as 0 . If input voltage is higher than 8 V , system judges it as 10 V (Suppose analog channel selects $0-10 \mathrm{~V}$ ). If Max frequency F111 is set to 50 Hz , the output frequency corresponding to $1-8 \mathrm{~V}$ is $0-50 \mathrm{~Hz}$.

- The filtering time constant is set by F405.

The greater the filtering time constant is, the more stable for the analog testing. However, the precision may decrease to a certain extent. It may require appropriate adjustment according to actual application.

- Channel proportional gain is set by F404.

If 1 V corresponds to 10 Hz and $\mathrm{F} 404=2$, then 1 V will correspond to 20 Hz .

- Corresponding setting for upper / lower limit of analog input are set by F401 and F403.

If Max frequency F111 is 50 Hz , analog input voltage $0-10 \mathrm{~V}$ can correspond to output frequency from -50 Hz to 50 Hz by setting this group function codes. Please set $\mathrm{F} 401=0$ and $\mathrm{F} 403=2$, then 0 V corresponds to -50 Hz , 5 V corresponds to 0 Hz and 10 V corresponds to 50 Hz . The unit of corresponding setting for upper / lower limit of input is in percentage (\%). If the value is greater than 1.00 , it is positive; if the value is less than 1.00 , it is negative. (e.g. $\mathrm{F} 401=0.5$ represents $-50 \%$ ).

If the running direction is set to forward running by F202, then $0-5 \mathrm{~V}$ corresponding to the minus frequency will cause reverse running, or vice versa.

Fig 6-14 correspondence of analog input to setting

The unit of corresponding setting for upper / lower limit of input is in percentage (\%). If the value is greater than 1.00 , it is positive; if the value is less than 1.00 , it is negative. (e.g. $\mathrm{F} 401=0.5$ represents $-50 \%)$.The corresponding setting benchmark: in the mode of combined speed control, analog is the accessorial frequency and the setting benchmark for range of accessorial frequency which relatives tc main frequency is "main frequency X "; corresponding setting benchmark for other cases is the "max frequency", as illustrated in the right

figure:
$\mathrm{A}=(\mathrm{F} 401-1)^{*}$ setting value
$B=(F 403-1) *$ setting value

| F406 Lower limit of AI2 channel input (V) | Setting range: $0.00 \sim$ F408 | Mfr's value: 0.04 |
| :---: | :---: | :---: |
| F407 Corresponding setting for lower limit of A12 input | Setting range: $0.00 \sim 2.00$ | Mfr's value: 1.00 |
| F408 Upper limit of AI2 channel input (V) | Setting range: F406 $\sim 10.00$ | Mfr's value: 10.00 |
| F409 Corresponding setting for upper limit of A12 input | Setting range: $0.00 \sim 2.00$ | Mfr's value: 2.00 |
| F410 AI2 channel proportional gain K2 | Setting range: $0.0 \sim 10.0$ | Mfr's value: 1.0 |
| F411 AI2 filtering time constant (S) | Setting range: $0.01 \sim 10.00$ | Mfr's value: 0.10 |
| F412 Lower limit of AI3 channel input (V) | Setting range: $0.00 \sim$ F414 | Mfr's value: 0.05 |
| F413 Corresponding setting for lower limit of A13 input | Setting range: $0.00 \sim 2.00$ | Mfr's value: 1.00 |
| F414 Upper limit of AI3 channel input (V) | Setting range: F412~10.00 | Mfr's value: 10.00 |
| F415 Corresponding setting for upper limit of AI3 input | Setting range: $0.00 \sim 2.00$ | Mfr's value: 2.00 |
| F416 AI3 channel proportional gain K1 | Setting range: $0.0 \sim 10.0$ | Mfr's value: 1.0 |
| F417 AI3 filtering time constant (S) | Setting range: $0.01 \sim 10.00$ | Mfr's value: 0.10 |

The function of AI2 and AI3 is the same with AI1.

| F418 | AI1 channel 0 Hz voltage dead zone $(\mathrm{V})$ | Setting range: $0.00 \sim 1.00$ | Mfr's value: 0.00 |
| :--- | :--- | :--- | :--- |
| F419 | AI2 channel 0 Hz voltage dead zone $(\mathrm{V})$ | Setting range: $0.00 \sim 1.00$ | Mfr's value: 0.00 |
| F420 | AI3 channel 0 Hz voltage dead zone $(\mathrm{V})$ | Setting range: $0.00 \sim 1.00$ | Mfr's value: 0.00 |

Analog input voltage $0-5 \mathrm{~V}$ can correspond to output frequency $-50 \mathrm{~Hz}-50 \mathrm{~Hz}(2.5 \mathrm{~V}$ corresponds to 0 Hz$)$ by setting the function of corresponding setting for upper / lower limit of analog input. The group function codes of F418, F419 and F420 set the voltage range corresponding to 0 Hz . For example, when $\mathrm{F} 418=0.5$, $\mathrm{F} 419=0.5$ and $\mathrm{F} 420=0.5$, the voltage range from $(2.5-0.5=2)$ to $(2.5+0.5=3)$ corresponds to 0 Hz . So if $\mathrm{F} 418=\mathrm{N}, \mathrm{F} 419=\mathrm{N}$ and $\mathrm{F} 420=\mathrm{N}$, then $2.5 \pm \mathrm{N}$ should correspond to 0 Hz . If the voltage is in this range, inverter will output 0 Hz . 0 HZ voltage dead zone will be valid when corresponding setting for lower limit of input is less than 1.00 . E2000 series inverters have two analog output channels.

|  | S421 Panel selection | Setting range: <br> 1: Local/ Remote keypad panel auto switch <br> 2: local keypad + remote control keypad |
| :--- | :--- | :--- |
| F422 Potentiometer selection | Mfr's value: 1 |  |
|  | Setting range: <br> $0:$ Potentiometer in local panel <br> $1:$ Potentiometer in remote control panel | Mfr's value: 0 |

When F421 is set to 0, local keypad panel is working. When F421 is set to 1, remote control keypad panel is working, and local keypad panel will be invalid for saving energy.
$\cdot$ F422 is used to select potentiometer, which is only suitable for LED keypad.
When F422 is set to 0 , the potentiometer in local LED panel is valid. When F422 is set to 1 , the potentiometer in remote LED keypad is valid.
The remote control panel is connected by 8 -cores net cable.

| F423 AO1 output range | Setting range: |
| :--- | :--- | :--- | :--- |
|  | $0: 0 \sim 5 \mathrm{~V} ;$ |
|  |  |
| $2: 4 \sim 20 \mathrm{~mA}$ | Mfr's value: 1 |

| F424 | AO1 lowest corresponding frequency $(\mathrm{Hz})$ | Setting range: $0.0 \sim$ F425 | Mfr's value: 0.05 |
| :--- | :--- | :--- | :--- |
| F425 | AO1 highest corresponding frequency $(\mathrm{Hz})$ | Setting range: $\mathrm{F} 424 \sim$ F111 | Mfr's value: 50.00 |
| F426 | AO1 output compensation $(\%)$ | Setting range: $0 \sim 120$ | Mfr's value: 100 |

- AO1 output range is selected by F 423 . When $\mathrm{F} 423=0$, AO1 output range selects $0-5 \mathrm{~V}$, and when $\mathrm{F} 423=1$, AO1 output range selects $0-10 \mathrm{~V}$ or $0-20 \mathrm{~mA}$. When $\mathrm{F} 423=2$, AO 1 output range selects $4-20 \mathrm{~mA}$ (When AO1 output range selects current signal, please turn the switch J 5 to "I" position.)
- Correspondence of output voltage range $(0-5 \mathrm{~V}$ or $0-10 \mathrm{~V})$ to output frequency is set by F424 and F425. For example, when $\mathrm{F} 423=0$, $\mathrm{F} 424=10$ and $\mathrm{F} 425=120$, analog channel AO 1 outputs $0-5 \mathrm{~V}$ and the output frequency is $10-120 \mathrm{~Hz}$.
- AO1 output compensation is set by F426. Analog excursion can be compensated by setting F426.

| F427 | AO2 output range | Setting range: <br> $0: 0 \sim 20 \mathrm{~mA} ; \quad 1: 4 \sim 20 \mathrm{~mA}$ | Mfr's value: 0 |
| :--- | :--- | :--- | :--- |
| F428 | AO2 lowest corresponding frequency (Hz) | Setting range: $0.0 \sim \mathrm{~F} 429$ | Mfr's value: 0.05 |
| F429 | AO2 highest corresponding frequency (Hz) | Setting range: $\mathrm{F} 428 \sim \mathrm{~F} 111$ | Mfr's value: 50.00 |
| F430 | AO2 output compensation (\%) | Setting range: $0 \sim 120$ | Mfr's value: 100 |

The function of AO 2 is the same as AO 1 , but AO 2 will output current signal, current signal of $0-20 \mathrm{~mA}$ and $4-20 \mathrm{~mA}$ could be selected by F427.

| F431 | AO1 analog output signal selecting | Setting range: <br> 0 : Running frequency; <br> 1: Output current; <br> 2: Output voltage; <br> 3: AI1 4: AI2 | Mfr's value: 0 |
| :---: | :---: | :---: | :---: |
|  |  |  |  |

| F432 | AO 2 analog output signal selecting | 5: Input pulse | Mfr's value: 1 |
|  |  | 6: Output torque |  |
|  |  | 7: Given by PC/PLC |  |
|  |  | 8: Target frequency |  |
|  |  | 9: Actual speed |  |
|  |  | 10: Output torque 2 |  |
|  |  | 11: Reserved |  |
|  |  | 12: Output power |  |
|  |  | 13: DO2 output |  |

- Token contents output by analog channel are selected by F431 and F432. Token contents include running frequency, output current and output voltage.
- When output current is selected, analog output signal is from 0 to twofold rated current.
- When output voltage is selected, analog output signal is from 0 V to rated output voltage.
- When actual speed is selected, the speed is actual speed in vector control mode. In the other mode, the speed is synchronous speed.
- 6: Output torque: indicating output torque absolute value. The max value of analog is corresponding to 3 tims of rated torque(F436).
$\cdot 10$ : output torque 2 : when output torque is higher than 0 , indicating present torque. When output torque is lower than 0 , there is no output. The max value of analog is corresponding to 3 tims of rated torque(F436).
-13: DO2 output: $\mathrm{F} 302=1, \mathrm{~F} 431=13, \mathrm{~F} 423=1$, and analog coding switch turns to voltage, after fault occurs,
A01 output 10 V . After the fault is reset, AO 1 output 0 V . if coding switch turns to current, AO1 will output 0 mA or 20 mA .

| F433 | Corresponding current for full range of external voltmeter | Setting range: | Mfr's value: 2.00 |
| :--- | :--- | :--- | :--- |
|  | F434 |  | $0.01 \sim 5.00$ |

- In case of $\mathrm{F} 431=1$ and AO1 channel for token current, F433 is the ratio of measurement range of external voltage type ammeter to rated current of the inverter.

In case of $\mathrm{F} 432=1$ and AO 2 channel for token current, F 434 is the ratio of measurement range of external current type ammeter to rated current of the inverter.
For example: measurement range of external ammeter is 20 A , and rated current of the inverter is 8 A , then, $\mathrm{F} 433=20 / 8=2.50$.

| F435 | Corresponding multiple of rated power for output <br> max analog value | Setting range: <br> $0.01 \sim 3.00$ | Mfr's value:2.00 |
| :--- | :--- | :--- | :--- |

- Analog output range is token as $0.01 \sim 3.00$ times of torque power.

| F436 Corresponding current multiple of rated torque for |
| :--- | :--- | :--- |
| output max analog value |$\quad$| Setting range: |
| :--- |
| $0.01 \sim 3.00$ |$\quad$ Mfr's value: 3.00

In vector control mode, analog is $0.01 \sim 3.00$ times of torque current.

| F438 Input signal of AI1 channel | Setting range: 0: voltage $1:$ current | Mfr's value: 0 |
| :--- | :--- | :--- |
| F439 Input signal of AI2 channel | Setting range: 0: voltage 1: current | Mfr's value: 1 |

When $\mathrm{F} 438=0$, AI1 channel is voltage signal input, when $\mathrm{F} 438=1$, AI1 channel is current signal input. When F439=0, AI1 channel is voltage signal input, when F439=1, AI1 channel is current signal input. The input signal should be matched with this parameter setting, and coding switch should be referred to Table 5-2 and 5-3.

### 6.5 Pulse input/output

| F440 Min frequency of input pulse FI (KHz) | Setting range: $0.00 \sim$ F442 | Mfr's value: 0.00 |
| :--- | :--- | :--- |
| F441 Corresponding setting of FI min <br> frequency | Setting range: $0.00 \sim$ F443 | Mfr's value: 1.00 |
| F442 Max frequency of input pulse FI (KHz) | Setting range: F440~100.00 | Mfr's value: 10.00 |
| F443 Corresponding setting of FI max <br> frequency | Setting range: <br> Max (1.00, F441) $\sim 2.00$ | Mfr's value: 2.00 |
| F445 Filtering constant of FI input pulse | Setting range: $0 \sim 1000$ | Mfr's value: 0 |
| F446 FI channel 0Hz frequency dead zone <br> (KHz) | Setting range: $0 \sim \mathrm{~F} 442$ <br> (Positive-Negative) | Mfr's value: 0.00 |
| F448 FI proportion gain | Setting range:0.001~2.000 | Mfr's value: 1.000 |

- Min frequency of input pulse is set by F440 and max frequency of input pulse is set by F442.

For example: when $\mathrm{F} 440=0 \mathrm{~K}$ and $\mathrm{F} 442=10 \mathrm{~K}$, and the $\max$ frequency is set to 50 Hz , then input pulse frequency $0-10 \mathrm{~K}$ corresponds to output frequency $0-50 \mathrm{~Hz}$.
-Filtering time constant of input pulse is set by F445.
The greater the filtering time constant is, the more steady pulse measurement, but precision will be lower, so please adjust it according to the application situation.
Corresponding setting of min frequency is set by F441 and corresponding setting of max frequency is set by F443.
When the max frequency is set to 50 Hz , pulse input $0-10 \mathrm{~K}$ can corresponds to output frequency $-50 \mathrm{~Hz}-50 \mathrm{~Hz}$ by setting this group function codes. Please set F441 to 0 and F 443 to 2, then 0K corresponds to $-50 \mathrm{~Hz}, 5 \mathrm{~K}$ corresponds to 0 Hz , and 10 K corresponds to 50 Hz . The unit of corresponding setting for $\mathrm{max} / \mathrm{min}$ pulse frequency is in percentage (\%). If the value is greater than 1.00 , it is positive; if the value is less than 1.00 , it is negative.
If the running direction is set to forward running by F202, $0-5 \mathrm{~K}$ corresponding to the minus frequency will cause reverse running, or vice versa.
$\cdot 0 \mathrm{~Hz}$ frequency dead zone is set by F446.
Input pulse $0-10 \mathrm{~K}$ can correspond to output frequency $-50 \mathrm{~Hz} \sim 50 \mathrm{~Hz}$ ( 5 K corresponds to 0 Hz ) by setting the function of corresponding setting for max/min input pulse frequency. The function code F446 sets the input pulse range corresponding to 0 Hz . For example, when $\mathrm{F} 446=0.5$, the pulse range from $(5 \mathrm{~K}-0.5 \mathrm{~K}=4.5 \mathrm{~K})$ to $(5 \mathrm{~K}+0.5 \mathrm{~K}=5.5 \mathrm{~K})$ corresponds to 0 Hz . So if $\mathrm{F} 446=\mathrm{N}$, then $5 \pm \mathrm{N}$ should correspond to 0 Hz . If the pulse is in this range, inverter will output 0 Hz .
0 HZ voltage dead zone will be valid when corresponding setting for min pulse frequency is less than 1.00 .

Fig 6-15 correspondence of pulse input and setting

The unit of corresponding setting for max/min input pulse frequency is in percentage (\%). If the value is greater than 1.00 , it is positive; if the value is less than 1.00 , it is negative. (e.g. F441=0.5 represents $-50 \%$ ).The corresponding setting benchmark: in the mode of combined speed control, pulse input is the accessorial frequency and the setting benchmark for range of accessorial frequency which relatives to main frequency ( $\mathrm{F} 205=1$ ) is "main frequency X "; corresponding setting benchmark for other cases is the "max frequency", as illustrated in the righ 1 figure:
$A=(F 441-1) *$ setting benchmark
$\mathrm{B}=(\mathrm{F} 443-1)$ *setting benchmark
$\mathrm{C}=\mathrm{F} 440 \quad \mathrm{~F}=\mathrm{F} 442 \quad$ (E-D) $/ 2=\mathrm{F} 446$

## Fig 6-16 relationship between pulse input and setting value

| F449 Max frequency of output pulse FO (KHz) | Setting range: $0.00 \sim 100.00$ | Mfr's value: 10.00 |
| :---: | :---: | :---: |
| F450 Zero bias coefficient of output pulse frequency (\%) | Setting range: $0.0 \sim 100.0$ | Mfr's value: 0.0 |
| F451 Frequency gain of output pulse | Setting range: $0.00 \sim 10.00$ | Mfr's value: 1.00 |
| F453 Output pulse signal | Setting range: <br> 0 : Running frequency <br> 1: Output current <br> 2: Output voltage <br> 3: AI1 4: AI2 <br> 5: Input pulse <br> 6: Output torque <br> 7: Given by PC/PLC <br> 8: Target frequency | Mfr's value: 0 |

- When DO1 is defined as high-speed pulse output terminal, the max frequency of output pulse is set byF449.
If "b" stands for zero bias coefficient, "k" stands for gain, " Y " stands for actual output of pulse frequency and " x " stands for standard output, then $\mathrm{Y}=\mathrm{Kx}+\mathrm{b}$.
Standard output x is the token value corresponding to output pulse $\mathrm{min} / \mathrm{max}$ frequency, which range is from zero to max value.
$\cdot 100$ percent of zero bias coefficient of output pulse frequency corresponds to the max output pulse frequency (the set value of F449.)
-Frequency gain of output pulse is set by F451. User can set it to compensate the deviation of output pulse. -Output pulse token object is set by F453. For example: running frequency, output current and output voltage, etc. -When output current is displayed, the range of token output is 0-2 times of rated current.
When output voltage is displayed, the range of token output is from 0-1.0 times of rated output voltage.

| F460 | AI1 channel input mode | Setting range: $0:$ straight line mode <br> $1:$ folding line mode | Mfr's value: 0 |
| :--- | :--- | :--- | :--- |
| F461 | AI2 channel input mode | Setting range: $0:$ straight line mode <br> $1:$ folding line mode | Mfr's value: 0 |
| F462 | AI1 insertion point A1 voltage value (V) | Setting range: F400~F464 | Mfr's value: 2.00 |
| F463 | AI1 insertion point A1 setting value | Setting range: $0.00 \sim 2.00$ | Mfr's value: 1.20 |
| F464 | AI1 insertion point A2 voltage value (V) | Setting range: F462~F466 | Mfr's value: 5.00 |
| F465 | AI1 insertion point A2 setting value | Setting range: $0.00 \sim 2.00$ | Mfr's value: 1.50 |
| F466 | AI1 insertion point A3 voltage value (V) | Setting range: $\mathrm{F} 464 \sim$ F402 | Mfr's value: 8.00 |

| F467 | AI1 insertion point A3 setting value | Setting range: $0.00 \sim 2.00$ | Mfr's value: 1.80 |
| :--- | :--- | :--- | :--- |
| F468 | AI2 insertion point B1 voltage value (V) | Setting range: F406~F470 | Mfr's value: 2.00 |
| F469 | AI2 insertion point B1 setting value | Setting range: $0.00 \sim 2.00$ | Mfr's value: 1.20 |
| F470 | AI2 insertion point B2 voltage value (V) | Setting range: F468~F472 | Mfr's value: 5.00 |
| F471 | AI2 insertion point B2 setting value | Setting range: $0.00 \sim 2.00$ | Mfr's value: 1.50 |
| F472 | AI2 insertion point B3 voltage value (V) | Setting range: F470 $\sim$ F412 | Mfr's value: 8.00 |
| F473 | AI2 insertion point B3 setting value | Setting range: $0.00 \sim 2.00$ | Mfr's value: 1.80 |

When analog channel input mode selects straight-line, please set it according to the parameters from F400 to F429. When folding line mode is selected, three points A1(B1) , A2(B2), A3(B3) are inserted into the straight line, each of which can set the according frequency to input voltage. Please refer to the following figure:

Fig 6-17 Folding analog with setting value
F400 and F402 are lower/upper limit of analog A11 input. When F460=1, F462=2.00V, F463=1.4, F111=50, F203 $=1$, F207 $=0$, then A1 point corresponding frequency is (F463-1) *F111 $=20 \mathrm{~Hz}$, which means 2.00 V corresponding to 20 Hz . The other points can be set by the same way.
AI2 channel has the same setting way as AI1.

| F475 | AO1 deviation compensation | Setting range: $0 \sim 5.00$ | Mfr's value: 1.00 |
| :--- | :--- | :--- | :--- |
| F476 | AO2 deviation compensation | Setting range: $0 \sim 5.00$ | Mfr's value:1.00 |

F475 is the compensation of min current when AO1 is chosen as $4 \sim 20 \mathrm{~mA}$ channel.
F476 is the compensation of min current when AO 2 is chosen as $4 \sim 20 \mathrm{~mA}$ channel.

| F477 | User-define speed control mode | Setting range: 0: Invalid 1: Valid | Mfr's value: 0 |
| :--- | :--- | :--- | :--- |
| F478 | Max limit of output frequency | Setting range:F113~F111 | Mfr's value:50.00 |

-When $\mathrm{F} 477=1,3$ kinds of control speed mode can be realized, $\mathrm{K} 1 * \mathrm{X}-\mathrm{K} 2 * \mathrm{Y}, ~ \mathrm{~K} 1 * \mathrm{X}+\mathrm{K} 2 * \mathrm{Y}-5 \mathrm{~V}, ~ \mathrm{~K} 1 * \mathrm{X}+\mathrm{K} 2 *$ (Y-5V).
For example: if main frequency is given by AI1, auxiliary frequency is given by AI2, K1=3, K2=2,

| Speed control mode | F203 | F204 | F207 | F221 | F206 | F111 | F478 | Remarks |
| :--- | :--- | :--- | :--- | :--- | :--- | :---: | :---: | :---: |
| 3*AI1-2*AI2 | 1 | 2 | 5 | - | $67 \%$ | 150.00 | 50.00 | F206=(K2 $\div$ K1)*100 <br> F111=K1*50.00 |
| 3*AI1+2*AI2-5V | 1 | 2 | 6 | $25 \%$ | $67 \%$ | 150.00 | 50.00 | F478 is max value of <br> output frequency. |
| 3*AI1+2*(AI2-5V) | 1 | 2 | 6 | $50 \%$ | $67 \%$ | 150.00 | 50.00 |  |

Note: the 3 kinds of speed control mode are valid only when the source of main frequency and auxiliary frequency are set according to F207.

### 6.6 Multi-stage Speed Control

The function of multi-stage speed control is equivalent to a built-in PLC in the inverter. This function can set running time, running direction and running frequency.
E2000 series inverter can realize 15 -stage speed control and 8 -stage speed auto circulating.
During the process of speed track, multi-stage speed control is invalid. After speed track is finished, inverter will run to target frequency according to the setting value of parameters.

|  | F500 | Stage speed type | Setting range:0: 3 -stage speed; <br> 1: 15 -stage speed; <br> 2: Max 8 -stage speed auto circulating |
| :--- | :--- | :--- | :--- |

$\cdot$ In case of multi-stage speed control (F203=4), the user must select a mode by F500. When F500 $=0$, 3 -stage speed is selected. When $F 500=1,15$-stage speed is selected. When $F 500=2$, max 8 -stage speed auto circulating is selected. When $\mathrm{F} 500=2$, "auto circulating" is classified into " 2 -stage speed auto circulating", " 3 -stage speed auto circulating", ... " 8 -stage speed auto circulating", which is to be set by F501.

Table 6-7 Selection of Stage Speed Running Mode

| F203 | F500 | Mode of Running | Description |
| :---: | :---: | :---: | :--- |
| 4 | 0 | 3-stage speed <br> control | The priority in turn is stage-1 speed, stage-2 speed and stage-3 speed. <br> It can be combined with analog speed control. If F207=4, "3-stage <br> speed control" is prior to analog speed control. |
| 4 | 1 | 15-stage speed <br> control | It can be combined with analog speed control. If F207=4, "15-stage <br> speed control" is prior to analog speed control. |
| 4 | 2 | Max 8-stage speed <br> auto circulating | Adjusting the running frequency manually is not allowable. "2-stage <br> speed auto circulating", "3-stage speed auto circulating", ". "8-stage <br> speed auto circulating" may be selected through setting the parameters. |

| F501 | Selection of Stage Speed Under <br> Auto-circulation Speed Control | Setting range: 2~8 | Mfr's value: 7 |
| :--- | :--- | :--- | :--- |
| F502 | Selection of Times of Auto-circulation <br> Speed Control | Setting range: $0 \sim 9999$ <br> (when the value is set to 0, the inverter <br> will carry out infinite circulating) | Mfr's value: 0 |
| F503 | Status After Auto-circulation <br> Running Finished. | Setting range: <br> $0:$ Stop 1: Keep running at last-stage speed | Mfr's value: 0 |

- If running mode is auto-circulation speed control (F203=4 and F500 $=2$ ), please set the related parameters by F501~F503.
- That the inverter runs at the preset stage speed one by one under the auto-circulation speed control is called as "one time".
- If F502 $=0$, inverter will run at infinite auto circulation, which will be stopped by "stop" signal.
- If $\mathrm{F} 502>0$, inverter will run at auto circulation conditionally. When auto circulation of the preset times is finished continuously (set by F502), inverter will finish auto-circulation running conditionally. When inverter keeps running and the preset times is not finished, if inverter receives "stop command", inverter will stop. If inverter receives "run command" again, inverter will automatically circulate by the setting time of F502.
- If F503 $=0$, then inverter will stop after auto circulation is finished. If $\mathrm{F} 503=1$, then inverter will run at the speed of the last-stage after auto-circulation is finished as follows:
e.g., $\mathrm{F} 501=3$, then inverter will run at auto circulation of 3 -stage speed;

F502 $=100$, then inverter will run 100 times of auto circulation;

F503 $=1$, inverter will run at the speed of the last stage after the auto-circulation running is finished.

Figure 6-18 Auto-circulating Running
Then the inverter can be stopped by pressing "stop" or sending "stop" signal through terminal during auto-circulation running.

| F504 Frequency setting for stage 1 speed (Hz) | Setting range:F112~F111 | Mfr's value: 5.00 |
| :---: | :---: | :---: |
| F505 Frequency setting for stage 2 speed (Hz) |  | Mfr's value: 10.00 |
| F506 Frequency setting for stage 3 speed (Hz) |  | Mfr's value: 15.00 |
| F507 Frequency setting for stage 4 speed (Hz) |  | Mfr's value: 20.00 |
| F508 Frequency setting for stage 5 speed (Hz) |  | Mfr's value: 25.00 |
| F509 Frequency setting for stage 6 speed (Hz) |  | Mfr's value: 30.00 |
| F510 Frequency setting for stage 7 speed (Hz) |  | Mfr's value: 35.00 |
| F511 Frequency setting for stage 8 speed (Hz) |  | Mfr's value: 40.00 |
| F512 Frequency setting for stage 9 speed (Hz) |  | Mfr's value: 5.00 |

| F516 Frequency setting for stage 13 speed (Hz) |  | Mfr's value: 25.00 |
| F517 Frequency setting for stage 14 speed (Hz) |  | Mfr's value: 30.00 |
| F518 Frequency setting for stage 15 speed (Hz) |  | Mfr's value: 35.00 |
| F519 ~ F533 Acceleration time setting for the speeds from Stage 1 to Stage 15 (S) | Setting range: $0.1 \sim 3000$ | Subject to invertermodel |
| F534~F548 Deceleration time setting for the speeds from Stage 1 to Stage 15 (S) | Setting range: $0.1 \sim 3000$ |  |
| F549~F556 <br> Running directions of stage speeds from Stage 1 to Stage 8 (S) | Setting range: <br> 0 : forward running; <br> 1: reverse running | Mfr's value: 0 |
| F573~F579 <br> Running directions of stage speeds from stage 9 to stage 15 (S) | Setting range: <br> 0 : forward running; <br> 1: reverse running | Mfr's value: 0 |
| F557~564 Running time of stage speeds from Stage 1 to Stage 8 (S) | Setting range: $0.1 ~ 3000$ | Mfr's value: 1.0 |
| F565~F572 Stop time after finishing stages from Stage 1 to Stage 8 (S) | Setting range: $0.0 \sim 3000$ | Mfr's value: 0.0 |
| F580 Stage-speed mode | Setting range: <br> 0 : Stage speed mode 1 <br> 1: Stage speed mode 2 | Mfr's value: 0 |

When $\mathrm{F} 580=0,0000$ means invalid, 0001 means the first speed, 1111 means the $15^{\text {th }}$ speed.
When $\mathrm{F} 580=1,0000$ means the first speed, 0001 means the second speed, and so on. 1111 means invalid.

### 6.7 Auxiliary Functions

|  |  | Setting range: <br> 0: Invalid; <br> 1: braking before starting; <br> 2: braking during stopping; <br> 3: braking during starting and stopping | Mfr's value: 0 |
| :--- | :--- | :--- | :--- |
| F600 | DC Braking Function Selection | Mfr's value: 1.00 |  |
| F601 | Initial Frequency for DC Braking (Hz) | Setting range: $0.20 \sim 50.00$ | Mfr's value: 50 |
| F602 | DC Braking efficiency before Starting | Setting range: <br> $0 \sim 250$ for 30 kW and below 30 kW <br> $0 \sim 200$ for above 30 kW | Mfr's value: 100 |
| F603 | DC Braking efficiency During Stop | Mfr's value: 0.50 |  |
| F604 | Braking Lasting Time Before Starting (S) | Setting range: $0.0 \sim 30.00$ | Mfr's value: 0 |
| F605 | Braking Lasting Time During Stopping $(\mathrm{S})$ |  |  |
| F656 Time of DC braking when stop | Setting range: $0.00 \sim 30.00$ |  |  |

- When $\mathrm{F} 600=0$, DC braking function is invalid.
- When $\mathrm{F} 600=1$, braking before starting is valid. After the right starting signal is input, inverter starts DC braking. After braking is finished, inverter will run from the initial frequency.

In some application occasion, such as fan, motor is running at a low speed or in a reverse status, if inverter starts immediately, OC malfunction will occur. Adopting "braking before starting" will ensure that the fan stays in a static state before starting to avoid this malfunction.
-During braking before starting, if "stop signal is given, inverter will stop by deceleration time.

When $\mathrm{F} 600=2$, DC braking during stopping is selected. After output frequency is lower than the initial frequency for DC braking (F601), DC braking will stop the motor immediately
During the process of braking during stopping, if "start" signal is given, DC braking will be finished and inverter will start.

F604

F605

Figure 6-19 DC braking
If "stop" signal is given during the process of braking during stopping, inverter will have no response and DC braking during stopping still goes on.

- When jogging function is valid, the function of braking before starting set by F600 is valid, and the function of speed track is invalid.
- When jogging function is invalid and F613-1, the function of braking before starting is invalid.
- Parameters related to "DC Braking": F601, F602, F603, F604, F605, interpreted as follows:
a. F601: Initial frequency of DC-braking. DC braking will start to work as inverter's output frequency is lower than this value.
b. F602/F603: DC braking efficiency (the unit is the percentage of rated current). The bigger value will result in a quick braking. However, motor will overheat with too big value.
c. F604: Braking duration before starting. The time lasted for DC braking before inverter starts.
d. F605: Braking duration when stopping. The time lasted for DC braking while inverter stops.
-Note: during DC braking, because motor does not have self-cold effect cause by rotating, it is in the state of easy over-heat. Please do not set DC braking voltage too high and do not set DC braking time to long.
DC braking, as shown in Figure 6-19.

| F606 | DC brake selection | Setting range: 0: Voltage type 1: Current type |
| :--- | :--- | :--- |
| Mfr's value: 1 |  |  |

|  |  | Setting range: <br> $0:$ disable <br> $1 \sim 2:$ Reserved <br> $3:$ Voltage/current control <br> 4: Voltage control <br> 5: Current control | Mfr's value: 3 |
| :--- | :--- | :--- | :--- |
| F607 | Selection of Stalling Adjusting Function |  |  |
| F608 | Stalling Current Adjusting (\%) | Setting range: $25 \sim$ FC49 | Mfr's value: 160 |
| F609 | Stalling Voltage Adjusting (\%) | Setting range: $110 \sim 200$ | Mfr's value: <br> S2/T2: 130 <br> $\mathrm{~T} 3: 140$ |
| F610 | Stalling Protection Judging Time (S) | Setting range: $0.0 \sim 3000$ | Mfr's value: 60.0 |

Initial value of stalling current adjusting is set by F608, when the present current is higher than rated current of inverter*F608, stalling current adjusting function is valid.

During the process of acceleration, if output current is higher than initial value of stalling current adjusting, inverter will not accelerate until the output current is lower than initial value of stalling current adjusting.
In case of stalling during stable speed running, the frequency will drop. In case of stalling during deceleration, the inverter will decrease the speed of deceleration. Until the output current is lower than initial value of stalling current adjusting, the inverter will return to normal deceleration.
F607 is used to set selection of stalling adjusting function.
Voltage control: when motor stops quickly or load changes suddenly, DC bus voltage will be high. Voltage control function can adjust deceleration time and output frequency to avoid OE.
When braking resistor or braking unit is used, please do not use voltage control function. Otherwise, the deceleration time will be changed.
Current control: when motor accelerates quickly or load changed suddenly, inverter may trip into OC. Current control function can adjust accel/decel time or decrease output frequency to control proper current value. It is only valid in VF control mode.
Note: (1) Voltage/current control is not suitable for lifting application.
(2) This function will change accel/decel time. Please use this function properly.

Initial value of stalling current adjusting is set by F608.
Initial value of stalling voltage adjusting is set by F609.
Stalling protection judging time is set by F610. When inverter starts stalling adjusting function and continues the setting time of F610, inverter will stop running and OL1 protection occurs.
Note:
When $\mathrm{F} 610=0$, inverter will not stop running and display OL1.
During stalling voltage adjusting, if customer presses STOP for 3 seconds, the inverter will be forced to stop

| F611 | Dynamic Braking threshold | Setting range: <br> T3: $600 \sim 2000$ <br> S2/T2: 320~2000 | Subject to inverter model |
| :--- | :--- | :--- | :--- |
| F612 | Dynamic braking duty ratio (\%) | Setting range: $0 \sim 100$ | Mfr's value: 100 |

Initial voltage of dynamic braking threshold is set by F611. When DC bus voltage is higher than the setting value of this function, dynamic braking starts, braking unit starts working. After DC bus voltage is lower than the setting value, braking unit stops working.
The value of F611 should be set according to input voltage. When the input voltage is 400 V , F611 should be set to 700 V , when input voltage is 460 V , F611 should be set to 770 V . The lower the dynamic braking threshold is, the better dynamic braking effect is. But the heat of braking resistor is more serious. The higher the dynamic braking threshold is, the worse dynamic braking effect is. And at the process of braking, inverter will easily trip to OE.
Dynamic braking duty ratio is set by F612, the range is $0 \sim 100 \%$. The value is higher, the braking effect is better, but the braking resistor will get hot.

| F620 Brake delay turn-off time | Setting range: <br> 0.0 (brake not closed when stop) <br> $0.1 \sim 3000$ | Mfr's value: 5.0 |
| :--- | :--- | :--- |

F620 $=0$, dynamic brake is not closed in stop status, it starts when PN voltage is higher than brake point; F620 $\neq 0$, dynamic brake can proceed normally when inverter is running, the time set by F620 is the delay time after stop, then the dynamic brake closes automatically.

|  |  | Setting range: |  |
| :--- | :--- | :--- | :--- |
| F613 | Speed track | 0: invalid | 1: valid for induction motor |
|  | 2: valid for induction motor at the first time | Mfr's value: 0 |  |
|  | 3:speed tracking mode 1 for PM motor |  |  |
|  | 4: speed tracking mode 2 for PM motor |  |  |

When $\mathrm{F} 613=0$, the function of speed track is invalid.
When F613=1, the function of speed track is valid for induction motor
After inverter tracks motor speed and rotating direction, inverter will start the rotating motor smoothly. This function is suitable for the situation of auto-starting after repowered on, auto-starting after reset, auto-starting when running command valid but direction signal lost and auto-starting when running command invalid.

When $\mathrm{F} 613=2$, the function is valid at the first time after inverter is power on.
When F613=3, it is suitable for low-inertia load of PM motor.
When $\mathrm{F} 613=4$, it is suitable for high inertia load of PM motor.

|  | Setting range: <br> F614 Speed track mode <br> $0:$ Speed track from frequency memory <br> 1: Speed track from zero | Mfr's value: 0 |
| :--- | :--- | :--- |
|  | 2: Speed track from max frequency |  |

When F614 is set to 0 , inverter will track speed down from frequency memory.
When F614 is set to 1 , inverter will track speed up from 0 Hz .
When F614 is set to 2, inverter will track speed down from max frequency.

| F615 Speed track rate | Setting range: $1 \sim 100$ | Mfr's value: 20 |
| :--- | :---: | :---: |

It is used to select the rotation velocity speed track when the rotation tracking restart mode is adopted. The larger the parameter is, the faster the speed track is. But if this parameter is too large, it likely results in unreliable tracking.

| F618 Delay time of speed track (S) | Setting range: $0.5 \sim 60.0$ | Mfr's value: 1.5 |
| :--- | :--- | :--- |

|  | Setting range: <br> 0: invalid <br> F631 $\quad$ VDC adjustment selection <br> 2: reserved <br> 3: valid at any time |  |
| :--- | :--- | :--- |
| F632 Target voltage of VDC <br> adjusting (V) | Setting range: 100~2300 | Mfr's value: subject to model |
| F633 frequency of VDC adjusting | Setting range: 0~100.00 | Mfr's value: 5.0 |
| F634 accelerating time of VDC <br> adjusting | Setting range: 0.1~3000.00 | Mfr's value: 0.1 |
| F635 decelerating time of VDC <br> adjusting | Setting range: 0.1~3000.00 | Mfr's value: 0.1 |
| F636 Proportion Gain of VDC <br> adjusting | Setting range: 0.01~20.00 | Mfr's value: 1.00 |
| F637 integration gain of VDC <br> adjusting | Setting range: 0~20.00 | Mfr's value: 1.50 |

During motor running process, the PN bus voltage will raise suddenly because of load mutation, over-voltage protection will occur. VDC adjustment is used to control voltage steady by adjusting output frequency or reducing braking torque.
When F631=1, VDC only works at stable running
When $\mathrm{F} 631=3$, VDC works at any time.
F632: If the DC bus voltage is higher than the setting value of F632, VDC adjustor will automatically adjust the bus voltage same as the value of F632.
F633: VDC can adjust the max frequency. If inverter often alarm with OE error, customer can increase this value.
F634 and F635 is to adjust accelerating and decelerating time.
F636 and F637: The bigger of F636 and F637 is , the faster the response is.
Please disable the current limit and voltage limit function (F607 $=0$ or 5 ) when customer use this function.

|  | Setting range: <br> 0: Copy forbidden <br> F638 Parameters copy enabled <br> ( varameters download 1 level and power are totally same) <br> 2: Parameters download 2 <br> (without considering voltage level and <br> power) | Mfr's value: 1 |
| :--- | :--- | :--- |

| F640 $\quad$ Parameter copy type | Setting range: <br> $0:$ Copy all parameters <br> 1: Copy parameters (except motor <br> parameters from F801 to F810/F844) | Mfr's value: 1 |

Please refer to the user manual of parameters copy.

The fault is as following:

| Code | Causes |
| :--- | :--- | :--- |
| Er71 Copy timeout | During copying process, there is no valid data during 3s. |
| Er72 Copy when running | Parameters copy when inverter is in the running status. |
| Er73 Copy without input password | Password is valid and user does not input password. |
| Er74 Copy between different models | If copy code, or voltage level or power is different, copy <br> is forbidden. |
| Er75 Copy forbidden | Parameters copy when F638=0 |

| F641 Inhibition of current oscillation <br> at low frequency | Setting range: $0 \sim 100$ <br> $0:$ Invalid | Subject to inverter model |
| :---: | :--- | :--- |

F641 is to inhibit the current oscillation at low frequency. The value of F641 is higher, the effect is better.
When F641 $=0$, inhibition function is invalid.
In the $\mathrm{V} / \mathrm{F}$ control mode, if inhibition of current oscillation is valid, the following parameters are needed to be set.
(1) F106=2 (V/F control mode) and F137 $\leq 2$;
(2) $\mathrm{F} 613=0$, the speed track function is invalid.

Note 1. When F641 is enable, one inverter can only drive one motor one time.
2. When F641 is enable, please set motor parameters (F801~F805, F844) correctly.
3. When this function is valid, and inverter runs without motor, output voltage may be unbalanced. This is normal situation. After inverter runs with motor, output voltage will be balanced.

|  |  | Setting range: |  |
| :--- | :--- | :--- | :--- |
| F643 | Multi-functional key | $0:$ Invalid |  |
|  |  | 1: FWD jogging | Mfr's value: 0 |
|  | 2. REV jogging |  |  |
|  | 3. Switchover between local/remote |  |  |

This function is valid only for remote control keypad.
When F643=3, after pressing multi-functional key and switchover, F200 and F201 will be changed to 3 automatically, which is MODBUS. If user wants to switch to keypad, F200 and F201 should be set again.
When $\mathrm{F} 643=4$, after pressing multi-functional keypad, inverter runs reversely. (this function is only valid for LED remote keypad.)
Note: when F643=4, no matter what the value of F202 is, after pressing run key, inverter will run forward, and after pressing multi-functional key, inverter will run reversely.

|  | Setting range: 0: Invalid <br> F644 <br> Keypad copy enabled <br>  | 2: current macro parameter upload |

For four-line LCD, the displayed contents at first two lines can be changed by setting F645.

| F646 Backlight time of LCD (S) | Setting range: $0 \sim 100$ | Mfr's value: 100 |
| :--- | :--- | :--- |
| F647 Language selection | Setting range: $0:$ Chinese <br> 1: English <br> 2: Deutsch | Mfr's value: 0 |
|  |  |  |

Change the duration of backlight by setting F646. F646=0, LCD light is always off; F646=100, LCD light is always on.
Change display language by setting F647, the default value is Chinese.

| F649 Keypad selection | Setting range: 0: Automatic identification <br> 1: LED remote keypad <br> 2: LCD remote keypad | Mfr's value: 0 |
| :--- | ---: | :--- |

When F649=0, inverter will indentify the keypad automatically.
When F649=1, only LED keypad is valid.
When F649=2, only LCD keypad is valid.
Note: when F421=2(Local+ remote keypad is valid). If LCD remote keypad is valid, the local keypad does not display.

| F657Instantaneous power failure <br> selection | Setting range: <br> 0: Invalid <br> 1: non-stop after power failure <br> 2: decelerate to stop after power failure |  |
| :---: | :--- | :--- |

When F657=1, upon instantaneous power failure or sudden voltage dip, the function enables the inverter to compensate the DC bus voltage reduction with the load feedback energy by reducing the output frequency so as to keep the inverter running continuously.
When $\mathrm{F} 657=2$, upon instantaneous power failure or sudden voltage dip, the frequency will decrease rapidly and inverter will decelerate to stop.
Note: 1. F663 and F664 are related parameters, please increase them properly.
2: This function is not suitable for the application of heavy load and small inertial load.

| F658 Voltage rally acceleration time (S) | Setting range: $0.0 \sim 3000$ <br> $0.0:$ F114 | Mfr's value: 0.0 |
| :--- | :--- | :--- |
| F659 Voltage rally deceleration time (S) | Setting range: $0.0 \sim 3000$ <br> $0.0:$ F115 | Mfr's value: 0.0 |
| F660 $\quad$ Action judging voltage at instantaneous <br> power failure (V) | Setting range: <br> 200~F661 | Subject to inverter <br> model |
| F661 Action stop voltage at instantaneous power <br> failure (V) | Setting range: <br> F660~1400 | Subject to inverter <br> model |

| F664 instantaneous integral coefficient Ki | Setting range: $0.00 \sim 10.00$ | Mfr's value: 0.30 |
| F751 Instantaneous stop pretreatment enable | Setting range: <br> $0:$ Invalid 1: Valid | Mfr's value: 0 |

-Upon instantaneous power failure or sudden voltage dip, the DC bus voltage of the inverter reduces. The function enables the inverter to compensate the DC bus voltage reduction with the load feedback energy by reducing the output frequency so as to keep the inverter running continuously.

- The function is suitable for big inertia load, such as, fan and centrifugal pump.
-The function is not suitable for the application which frequency is forbidden being decreased.
- When the bus voltage resumes to normal, $\mathrm{F} 658 / \mathrm{F} 659$ are used to set the accel/decel time when inverter runs to target frequency.
- When instantaneous function is valid, if PN voltage is lower than F660, instantaneous function works.
- When inverter is at instantaneous status, if PN voltage is higher than F661, the bus voltage remains to normal, inverter will work normally and run to target frequency.

| F670 | Voltage-limit current-limit adjustment coefficient | Setting range: 0.01~10.00 | Mfr's value: 2.00 |
| :--- | :--- | :--- | :--- |

Lower this factor properly if frequent over-voltage protection occurs in the process of deceleration; Increase the factor when deceleration is too slow.

| F671 voltage source for V/F separation | Setting range: <br> 0: F672 1: AI1 2:AI2 3: AI3 <br> 4: Communication setting <br> 5: pulse setting 6: PID <br> 7~10: reserved | Mfr's value: 0 |
| :---: | :---: | :---: |
| F672 Voltage digital setting for V/F separation | Setting range: $0.00 \sim 100.00$ | Mfr's value: 100.0 |

F671 is $100 \%$ of the setting corresponds to the rated motor voltage.

- 0: digital setting, the output voltage is set by F672.
- 1: AII; 2:AI2; 3: AI3;

The output voltage is set by analog.

- 4: Communication setting

The output voltage is set by PC/PLC, the communication address is 2009 H , the given range is $0 \sim 10000$, which means $0 \sim 100 \%$ of rated voltage.

- 5 pulse setting

The output voltage is set by external high-speed pulse. The input frequency of pulse corresponds to motor rated voltage.

- 6: PID

The output voltage is set by PID. PID adjustment corresponds to $100 \%$ of motor rated voltage. For details, please refer to PID parameters group.

| F673 Lower limit of voltage at V/F <br> separation (\%) | Setting range: $0.00 \sim$ F674 | Mfr's value: 0.00 |
| :---: | :--- | :--- |
| F674 Upper limit of voltage at V/F <br> separation (\%) | Setting range: F673~100.00 | Mfr's value: 100.00 |

-When the voltage is lower than F673, the voltage should equal to F673. When the voltage is higher than F674, the voltage should equal to F674.

| F675 Voltage rise time of V/F separation (S) | Setting range: $0.0 \sim 3000.0$ | Mfr's value: 5.0 |
| :--- | :--- | :--- |
| F676 Voltage decline time of V/F separation (S) | Setting range: $0.0 \sim 3000.0$ | Mfr's value: 5.0 |

F675 is the time required for the output voltage to rise from 0 V to the rated motor voltage.
F676 is the time required for the output voltage to decline from the rated motor voltage to 0 V .

| F677 Stop mode at V/F separation | Setting range: <br> $0:$ voltage and frequency declines to 0 <br> according to respective time. | Mfr's value: 0 |
| :--- | :--- | :--- |

|  | 1 : Voltage declines to 0 first |  |
| :--- | :--- | :--- |
|  | 2 : frequency declines to 0 first. |  |

-When F677 $=0$, voltage and frequency declines to 0 according to respective time, inverter will stop when frequency declines to 0 .
-When $\mathrm{F} 677=1$, voltage will decline to 0 at first. After voltage is 0 , frequency will decline to 0 .

- When $\mathrm{F} 677=2$, frequency will decline to 0 at first. After frequency is 0 , voltage will decline to 0 .

| F678 Judgment voltage at V/F separation | Setting range: 0: invalid <br> 1: auto judgment | Mfr's value: 0 |
| :--- | :--- | :--- |
| F679 Voltage switch point at V/F separation <br> $(V)$ | Setting range: $200 \sim 600$ | Mfr's value: 430 |
| F680 Switch point width at V/F separation (\%) | Setting range: $0.0 \sim 100.0$ | Mfr's value: 0.5 |

When $\mathrm{F} 678=0$, judgment voltage is invalid.
When $\mathrm{F} 678=1$, input voltage is judged automatically. When input voltage is higher than (F679
$+\mathrm{F} 679 * \mathrm{~F} 680$ ), the current input voltage is judged to T3 380V. If input voltage is lower than (F679
$+\mathrm{F} 679 * \mathrm{~F} 680$ ), the current input voltage is judged to S 2220 V .

### 6.8. Malfunction and Protection

| F700 | Selection of terminal free stop mode | Setting range: <br> 0: free stop immediately; <br> 1: delayed free stop | Mfr's value: 0 |
| :--- | :--- | :--- | :--- |
| F701 | Delay time for free stop and programmable terminal action | Setting range: $0.0 \sim 60.0 \mathrm{~S}$ | Mfr's value: 0.0 |

. "Selection of free stop mode" can be used only for the mode of "free stop" controlled by the terminal. The related parameters setting is $\mathrm{F} 201=1,2,4$.
When "free stop immediately" is selected, delay time (F701) will be invalid and inverter will free stop immediately.
. "Delayed free stop" means that upon receiving "free stop" signal, the inverter will execute "free stop" command after waiting some time instead of stopping immediately. Delay time is set by F701. During the process of speed track, the function of delayed free stop is invalid.

|  |  | 0: controlled by temperature <br> F702 <br> Fan control mode | 1: Running when inverter is powered on. |
| :--- | :--- | :--- | :--- |
|  | 2: controlled by running status |  |  |
| $3:$ Fan runs periodically |  |  |  |

- When $\mathrm{F} 702=0$, fan will run if radiator's temperature is up to setting temperature.
- When F702=2, fan will run when inverter begins running. When inverter stops, fan will run according to the temperature of radiator.
- To control fan's running can increase the life of fan.
- When $\mathrm{F} 702=3$, fan is controlled by temperature. When the temperature is lower, fan will run 1 minute every 24 hours.

| F704 | Inverter Overloading pre-alarm Coefficient (\%) | Setting range: $50 \sim 100$ | Mfr's value: 80 |
| :--- | :--- | :--- | :--- |
| F705 | Motor Overloading pre-alarm Coefficient (\%) | Setting range: $50 \sim 100$ | Mfr's value: 80 |
| F706 | Inverter Overloading Coefficient (\%) | Setting range: $120 \sim 190$ | Mfr's value: 150 |
| F707 | Motor Overloading Coefficient (\%) | Setting range: $20 \sim 100$ | Mfr's value: 100 |

-When inverter or motor is in over current status, if the accumulation time is more than inverter's or motor's overload protection time * F704 or F705, and F300 or F301 or F302 $=10$ or 11, inverter will output ON signal.
Inverter overloading coefficient: the ratio of overload-protection current and rated current, whose value shall be subject to actual load.

- Motor overloading coefficient (F707): when inverter drives lower power motor, please set the value of F707 by below formula in order to protect motor

$$
\text { Motor Overloading Coefficient }=\frac{\text { Actual motor power }}{\text { Matching motor power }} \quad \times 100 \% \text { 。 }
$$

Please set F707 according to actual situation. The lower the setting value of F707 is, the faster the overload protection speed. Please refer to Fig 6-20.
For example: 7.5 kW inverter drives 5.5 kW motor, $\quad \mathrm{F} 707=\frac{5.5}{7.5} \times 100 \% \approx 70 \%$. When the actual current of motor reaches $140 \%$ of inverter rated current, inverter overload protection will display after 1 minute.

When the output frequency is lower than 10 Hz , the heat dissipation effect of common motor will be worse. So when running frequency is lower than 10 Hz , the threshold of motor overload value will be reduced. Please refer to Fig 6-21 (F707=100\%):

Fig 6-21 Motor overload protection value

| F708 | Record of The Latest Malfunction Type |  |  |

| F721 | Record of overvoltage protection fault times |  |  |
| F722 | Record of overheat protection fault times |  |  |
| F723 | Record of overload protection fault times |  |  |
| F724 | Input phase loss | Setting range: <br> 0 : invalid; 1: valid | Mfr's value: S2: 0 T2/T3: 1 |
| F725 | Under-voltage protection | Setting range: <br> 0 : reset manually 1: reset automatically | Mfr's value: 2 |
| F726 | Overheat | Setting range: <br> 0 : invalid; 1: valid | Mfr's value: 1 |
| F727 | Output phase loss | Setting range: 0 : invalid; 1 : valid | Mfr's value: 1 |
| F728 | Input phase loss filtering constant (S) | Setting range: $1 \sim 60$ | Mfr's value: 5 |
| F729 | Under-voltage filtering constant ( $2 \mathrm{mS} \mathrm{)}$ | Setting range: $1 \sim 3000$ | Mfr's value: 5 |
| F730 | Overheat protection filtering constant (S) | Setting range: $0.1 \sim 60.0$ | Mfr's value: 5.0 |
| F732 | Under-voltage protection voltage threshold (V) | Setting range: T2/S2: 120~450 T3: 300~450 | Subject to inverter model |

"Input phase loss" refers to phase loss of three-phase power supply, 7.5 kW and below 7.5 kW do not have this function.
"Output phase loss" refers to phase loss of inverter three-phase wirings or motor wirings.
"Under-voltage" / "phase loss" signal filtering constant is used for the purpose of eliminating disturbance to avoid mis-protection. The greater the set value is, the longer the filtering time constant is and the better for the filtering effect.

| F737 Over-current 1 protection | Setting range: 0:Invalid 1: Valid | Mfr's value: 1 |
| :--- | :--- | :--- |
| F738 Over-current 1 protection coefficient | Setting range: $0.50 \sim 3.00$ | Mfr's value: 2.5 |
| F739 Over-current 1 protection record |  |  |

- F738= OC 1 value/inverter rated current
- In running status, F738 is not allowed to modify. When over-current occurs, OC1 is displayed

|  | Setting range: <br> 0: Invalid <br> 1: Stop and AErr displays. <br> 2: Stop and Aerr is not displayed. <br> 3: Inverter runs at the min frequency. <br> 4: Reserved. | Mfr's value: 0 |
| :--- | :--- | :--- |
| F742 Threshold of disconnected protection <br> protection (\%)  | Sisconnected | Setting range: $1 \sim 100$ |

When the values of F400 and F406 are lower than 0.10 V , analog disconnected protection is invalid. Analog channel AI3 has no disconnected protection.
When F741 is set to 1, 2 or 3, the values of F400 and F406 should be set to 1 V-2V, to avoid the error protection by interference.
Analog disconnected protection voltage=analog channel input lower limit * F742. Take the AI1 channel for the example, if $\mathrm{F} 400=1.00$, $\mathrm{F} 742=50$, then disconnection protection will occur when the AIl channel voltage is lower than 0.5 V .

| F745 Threshold of pre-alarm overheat (\%) | Setting range: $0 \sim 100$ | Mfr's value: 80 |
| :--- | :--- | :--- |
| F746 Carrier frequency auto-adjusting <br> threshold | Setting range: 60~100 | Mfr's value: 75 |
| F747 Carrier frequency auto-adjusting | Setting range: 0 : Invalid $\quad$ 1: Valid | Mfr's value: 1 |

When the temperature of radiator reaches the value of $90^{\circ} \mathrm{C} * \mathrm{~F} 745$ and multi-function output terminal is set to 16 (Please refer to F300~F302), it indicates inverter is in the status of overheat.
When temperature is higher than setting temperature, F746 is used to reduce carrier frequency.
When $\mathrm{F} 747=1$, the temperature of radiator reaches to certain temperature, inverter carrier frequency will adjust automatically, to decrease the temperature of inverter. This function can avoid overheat malfunction. When $\mathrm{F} 159=1$, random carrier frequency is selected, F 747 is invalid.

| F750 Grounding delay (S) | $0.0 \sim 3600.0$ | 2.0 |
| :--- | :--- | :--- |

When grounding protection is valid, the time interval between stop and start is lower than the setting value of F750, the grounding detection is not performed.

| F752 Overload quitting coefficient | Setting range: $0.1 \sim 20.0$ | Mfr's value: 1.0 |  |
| :--- | :--- | :--- | :--- |
| F753 | Selection of overload protection | Setting range: <br> $0:$ Normal motor <br> $1:$ variable frequency motor | Mfr's value: 1 |

-The bigger the setting value of F 752 is, the faster the shortened overload cumulative time is.
When $\mathrm{F} 753=0$, because heat dissipation effect of normal motor is bad in low speed, the electronic thermal protection value will be adjusted properly. It means overload protection threshold of motor will be decreased when running frequency is lower than 30 Hz .
When F753=1, because heat dissipation effect of variable frequency motor is not influenced by speed, there is no need to adjust the protection value.

| F754 Zero-current threshold (\%) | Setting range: $0 \sim 200$ | Mfr's value: 5 |
| :--- | :--- | :--- |
| F755 Duration time of zero-current (S) | Setting range: $0 \sim 60.0$ | Mfr's value: 0.5 |

When the output current is fallen to zero-current threshold, and after the duration time of zero-current, ON signal is output.

| F756 Delay time when drive runs (ms) | Setting range: 0 : Invalid $\quad 1 \sim 5000$ | Mfr's value: 0 |
| :--- | :--- | :--- |
| F757 Delay time when drive stops (S) | Setting range: $0.0 \sim 100.0$ | Mfr's value: 5.0 |

When $\mathrm{F} 756=0$, bus voltage base is not detected when voltage limiting.
When $\mathrm{F} 756 \neq 0$, after SD close, bus voltage will be detected recurrently after setting delay time.
-After the drive stops, bus voltage will be detected recurrently after setting delay time. The detected value is saved in H016.

| F759 | Carrier-frequency ratio | Setting range: $3 \sim 15$ |
| :--- | :--- | :--- | Mfr's value: 15

-carrier frequency=motor rated frequency *F759. When the product of rated frequency and F759 is higher than carrier frequency, actual carrier frequency will be increased automatically, and it will not be limited by temperature control carrier frequency.

|  | Setting range: <br> F: Invalid <br> F760 | Grounding protection | s: Valid after power on |
| :--- | :--- | :--- | :--- |
|  |  | s: Valid after running |  |
|  | 3: Valid after power on and running inverter |  |  |
| 3odel |  |  |  |

When output terminals $(\mathrm{U}, \mathrm{V}, \mathrm{W})$ are connected to the earth or the earth impedance is too low, then the leak current is high, inverter will trip into GP.
F760 $=0$, grounding protection is invalid.
$\mathrm{F} 760=1$, grounding detection is performed after power on.
F760 $=2$, grounding detection is performed after running.
$\mathrm{F} 760=3$, grounding detection is performed after power on and running.
Note: this function is invalid for T 2 series.

| F761 Switchover mode of FWD/REV | Setting range: 0 : At zero <br> 1: at start frequency | Mfr's value: 0 |
| :--- | :--- | :--- |

- When F761 $=0$, FWD/REV switches at zero frequency, F120 is valid.
-When F761 $=1$, FWD/REV switches at start frequency, F120 is invalid, if start frequency is too high, current shock will occur during switchover process.

| F770 Auxiliary version No. |  |  |
| :--- | :--- | :--- |

-It only can be checked.

|  | Setting range: |  |
| :--- | :--- | :--- |
| F772 Motor temperature detection channel | 0: Invalid | 1: AI1(PT100) |
| selection | 2: AI2(PT100) | Mfr's value: 0 |
|  | 3: AI1(PT1000) |  |
|  | 4: AI2(PT1000) |  |
| F773 Motor overheat alarm threshold ( ${ }^{\circ} \mathrm{C}$ ) | Setting range: F774~200 | Mfr's value: 110 |
| F774 Motor overheat pre-alarm threshold ( ${ }^{\circ} \mathrm{C}$ ) | Setting range: $0 \sim$ F773 | Mfr's value: 90 |

$\cdot \mathrm{F} 772$ is used to select motor temperature detection channel. AI1 or AI2 must select $0 \sim 5 \mathrm{~V}$ voltage input.
-F773 is motor overheat alarm threshold. When motor temperature is higher than it, inverter will trip into OH 4 .
-F774 is motor overheat pre-alarm threshold, when motor temperature is higher than it, DO token output is valid.

### 6.9. Parameters of the Motor

|  |  | Setting range: <br> 0: Invalid; <br> 1: Rotating tuning; <br> 2: stationary tuning | Mfr's value: 0 |
| :--- | :--- | :--- | :--- |
| F801 | Rated power (kW) | Setting range: $0.1 \sim 1000.0$ |  |
| F802 | Rated voltage (V) | Setting range: $1 \sim 1300$ |  |
| F803 | Rated current (A) | Setting range: $0.2 \sim 6553.5$ |  |
| F804 | Number of motor poles | Setting range: $2 \sim 100$ | 4 |
| F805 | Rated rotary speed (rmp $/ \mathrm{min})$ | Setting range: $1 \sim 39000$ |  |
| F810 | Motor rated frequency $(\mathrm{Hz})$ | Setting range: $1.00 \sim 590.00$ | 50.00 |

-Please set the parameters in accordance with those indicated on the nameplate of the motor.
-Excellent control performance of vector control requires accurate parameters of the motor. Accurate parameter tuning requires correct setting of rated parameters of the motor.
-In order to get the excellent control performance, please configurate the motor in accordance with adaptable motor of the inverter. In case of too large difference between the actual power of the motor and that of adaptable motor for inverter, the inverter's control performance will decrease remarkably.
$\cdot \mathrm{F} 800=0$, parameter tuning is invalid. But it is still necessary to set the parameters F801~F803, F805 and F810 correctly according to those indicated on the nameplate of the motor.

After being powered on, it will use default parameters of the motor (see the values of F806-F809) according to the motor power set in F801. This value is only a reference value in view of Y series 4-pole asynchronous motor. For PMSM, please input motor parameters to F870~F873 manually.
$\cdot \mathrm{F} 800=1$, rotating tuning.
In order to ensure dynamic control performance of the inverter, select "rotating tuning" after ensuring that the motor is disconnected from the load. Please set F801-805 and F810 correctly prior to running testing. If control mode is closed-loop vector control, please set F851 correctly.
Operation process of rotating tuning: Press the "Run" key on the LED keypad to display "TEST", press "Run" key on the LCD keypad to display "parameter measurement...." and it will tune the motor's parameter of two stages. After that, the motor will accelerate according to acceleration time set at F114 and maintain it for a certain period. The motor will then decelerate to 0 according to the time set at F115. After auto-checking is completed, relevant parameters of the IM motor will be stored in function codes F806~F809. And relevant parameters of PMSM will be stored in F870~F873. F800 will turn to 0 automatically
$\cdot \mathrm{F} 800=2$, stationary tuning.
It is suitable for the cases where it is impossible to disconnect the motor from the load.
Press the "Run" key, and the inverter will display "TEST", and it will tune the motor's parameter of two stages. The motor's stator resistance, rotor resistance and leakage inductance will be stored in F806-F809 automatically (the motor's mutual inductance uses default value generated according to the power). For PMSM, electric parameters are stored to F870~F873. F870 is theory value, user can ask the accurate back electromotive force from manufacture. And F800 will turn to 0 automatically. The user may also calculate and input the motor's mutual inductance value manually according to actual conditions of the motor. With regard to calculation formula and method, please call us for consultation.
When tuning the motor's parameter, motor is not running but it is powered on. Please do not touch motor during this process.

## *Note:

1. No matter which tuning method of motor parameter is adopted, please set the information of the motor (F801-F805) correctly according to the nameplate of the motor. If the operator is quite familiar with the motor, the operator may input all the parameters (F806-F809) of the motor manually.
2. Parameter F804 can only be checked, not be modified.
3. Incorrect parameters of the motor may result in unstable running of the motor or even failure of normal running. Correct tuning of the parameters is a fundamental guarantee of vector control performance.
Each time when F801 rated power of the motor is changed, the parameters of the motor (F806-F809) will be refreshed to default settings automatically. Therefore, please be careful while amending this parameter.
The motor's parameters may change when the motor heats up after running for a long time. If the load can be disconnected, we recommend auto-checking before each running.

| F806 | Stator resistance ( $\Omega$ ) | Setting range: <br> $0.001 \sim 65.53 \Omega$ (for 15 kw and below 15 kw ) <br> $0.1 \sim 6553 \mathrm{~m} \Omega$ (For above 15 kw ) | Subject to inverter model |
| :---: | :---: | :---: | :---: |
| F807 | Rotor resistance ( $\Omega$ ) | Setting range: <br> $0.001 \sim 65.53 \Omega$ (for 152 kw and below 15 kw ) <br> $0.1 \sim 6553 \mathrm{~m} \Omega$ (For above 15 kw ) |  |
| F808 | Leakage inductance (mH) | Setting range: <br> $0.01 \sim 655.3 \mathrm{mH}$ (for 15 kw and below 15 kw ) <br> $0.001 \sim 65.53 \mathrm{mH}$ (for above 15 kw ) |  |
| F809 | Mutual inductance ( mH ) | Setting range: <br> $0.1 \sim 6553 \mathrm{mH}$ (for 15 kw and below 15 kw ) <br> $0.01 \sim 655.3 \mathrm{mH}$ (for above 15 kw ) |  |
| F844 | Motor no-load current (A) | Setting range: 0.1~F803 |  |

$\cdot$ The set values of $\mathrm{F} 806 \sim$ F809 will be updated automatically after normal completion of parameter tuning of the motor.
$\cdot$ If it is impossible to measure the motor at the site, input the parameters manually by referring to the known parameters of a similar motor.
F844 can be got automatically by rotating tuning.
If the no-load current is higher when motor is running, please decrease the value of F844.
If running current or start current is higher when motor is running with load, please increase the value of F844.
Take a 3.7 kW inverter for the example: all data are $3.7 \mathrm{~kW}, 400 \mathrm{~V}, 8.8 \mathrm{~A}, 1440 \mathrm{rpm}, 50 \mathrm{~Hz}$, and the load is disconnected. When $\mathrm{F} 800=1$, the operation steps are as following:

F811 Carrier frequency switchover point (Hz)
Setting range: $0.00 \sim 20.00$
Mfr's value: 8.00
-When $\mathrm{F} 811=0$, there is no carrier frequency switchover.
-When $\mathrm{F} 811 \neq 0$, and frequency is lower than switchover point, carrier frequency is internal fixed carrier-frequency. When running frequency is higher than switchover point, carrier frequency will switch to setting carrier frequency.

| F812 | Pre-exciting time (S) | Setting range: $0.00 \sim 30.00$ | 0.10 |
| :--- | :--- | :--- | :--- |
| F813 | Rotary speed loop KP1 | Setting range: $1 \sim 100$ | 30 |
| F814 | Rotary speed loop KI1 | Setting range: $0.01 \sim 10.00$ | 0.50 |
| F815 | Rotary speed loop KP2 | Setting range: $1 \sim 100$ | Subject to inverter model |
| F816 | Rotary speed loop KI2 | Setting range: $0.01 \sim 10.00$ | 1.00 |
| F817 | PID switching frequency 1 | Setting range: $0 \sim$ F818 | 5.00 |
| F818 | PID switching frequency 2 | Setting range: F817~F111 | 10.00 |

Fig 6-22 PID parameter

Dynamic response of vector control speed can be adjusted through adjusting proportional and storage gains of speed loop. Increasing KP and decreasing KI can speed up dynamic response of speed loop. However, if proportional gain or storage gain is too large, it may give rise to oscillation.
Recommended adjusting procedures:
Make fine adjustment of the value on the basis of manufacturer value if the manufacturer setting value cannot meet the needs of practical application. Be cautious that amplitude of adjustment each time should not be too large.
In the event of weak loading capacity or slow rising of rotary speed, please decrease the value of KP first under the precondition of ensuring no oscillation. If it is stable, please increase the value of KI properly to speed up response.
In the event of oscillation of current or rotary speed, decrease KP and increase KI properly.
Note: Improper setting of KP and KI may result in violent oscillation of the system, or even failure of normal operation. Please set them carefully.

| F819 Slip coefficient | Setting range: $10 \sim 200$ | Mfr's value: 100 |
| :--- | :--- | :--- |
| F820 Filtering coefficient of speed loop | Setting range: $0 \sim 100$ | Mfr's value: 0 |

F819 is used to adjust steady speed precision of motor in vector control.
In vector control mode, if speed fluctuation is higher or inverter stops instability, please increase the value of F820 properly; it will influence response speed of speed loop.

| F821 | Over-excitation gain | Setting range: $0.0 \sim 50.0$ | Mfr's value: 30.0 |
| :--- | :--- | :--- | :--- |

This function could hold the pump voltage at DC bus.
The value is higher, the effect of the function is better. But the output current during deceleration is also higher. It is possible to cause over-current protection.

The parameter of F822 limits the output current in the vector control mode.

| F838 | SVC control mode | Setting range: <br> $1:$ control mode 1 2: control mode 2 | Mfr's value: 2 |
| :--- | :--- | :--- | :--- |

## F838=1, SVC control mode 1. F838=2, SVC control mode 2.

-This function is used to modify motor weak magnetism curve. The smaller the value is, the shallower the weak magnetism depth is. The bigger the value is, the deeper the weak magnetism depth is.

|  | Setting range: | Mfr's value: 0 |
| :--- | :--- | :--- |
|  | 0 : By feedback speed |  |

$\cdot \mathrm{F} 840=0$, in deceleration process, inverter will stop until feedback speed meets the needs of stop command. 。 $\cdot \mathrm{F} 840=1$, in deceleration process, inverter will stop until given speed meets the needs of stop command.

| F847 Encoder disconnection detection time(s) | Setting range: $0.1 \sim 10.0$ | Mfr's value: 2.0 |
| :--- | :--- | :--- |

This parameter is only valid in encoder vector control mode. Using F847 to define the encoder signal disconnection detection time under the closed-loop vector control mode when F106=1. PG protection is given if detection time exceeds the setting value.

| F850 Detection threshold of encoder disconnection | Setting range: $5 \sim 100$ | Mfr's value: 30 |
| :--- | :--- | :--- |

In the closed-loop vector control mode, when the difference between encoder setting frequency and actual frequency is higher than F850, and duration time is longer than F847, inverter will trip into PG.

| F851 Encoder resolution | Setting range: $1 \sim 9999$ | Mfr's value: 1000 |
| :--- | :--- | :--- |

Note: when F106=1, PG card must be installed, and set encoder resolution correctly

| F854 Encoder phase sequence | Setting range: 0 : forward direction <br> $1:$ reverse direction | Mfr's value: 0 |
| :--- | :--- | :--- |

F854 is used to set phase sequence of differential and non-differential ABZ incremental encoder. In closed-loop vector mode, correct encoder phase sequence can be got by rotating tuning.
If motor parameters cannot be studied by rotating tuning, please set F854 by checking H015 value.
For example, inverter runs more than 5 s in V/F control mode, after inverter stops, then check the value of H 015 . If $\mathrm{H} 015=0$, please do not change the value of F 854 . If $\mathrm{H} 015=1$, then change the value of F 854 .

| F866 | Static position identification | Setting range: 0: Invalid 1: Valid <br> 2: valid at first running | Mfr's value: 2 |
| :--- | :--- | :--- | :--- |
| F867 | Position identification current | Setting range: $0 \sim 30$ | Mfr's value: 10 |
| F868 | Position identification frequency | Setting range: $2000 \sim 16000$ | Mfr's value: 10000 |

-F868: during position identification process, F868 is the frequency of output high-frequency voltage.
Note: F866~F868 is only for synchronous motor.

| F870 | PMSM back electromotive force <br> $(\mathrm{mV} / \mathrm{rpm})$ | Setting range: $0.1 \sim 6553.0$ <br> $($ valid value between lines) | Mfr's value: 100.0 |
| :--- | :--- | :--- | :--- |
| F871 | PMSM D-axis inductance $(\mathrm{mH})$ | Setting range: $0.01 \sim 655.30$ | Mfr's value:5.00 |

| F872 | PMSM Q-axis inductance $(\mathrm{mH})$ | Setting range: $0.01 \sim 655.30$ | Mfr's value:7.00 |
| :--- | :--- | :--- | :--- |
| F873 | PMSM stator resistance $\quad(\Omega)$ | Setting range: $0.001 \sim 65.530$ <br> (phase resistor) | Mfr's value:0.500 |

* F870(back electromotive force of PMSM, unit $=0.1 \mathrm{mV} / 1 \mathrm{rpm}$, it is back electromotive force value between lines), it is forbidden to revert to Mfr's value by F160.
* F871 (PMSM D-axis inductance, unit $=0.01 \mathrm{mH}$ ), it is forbidden to revert to Mfr's value by F160.
* F872(PMSM Q-axis inductance, unit $=0.01 \mathrm{mH}$ ), it is forbidden to revert to Mfr's value by F160.
* F873(PMSM Stator resistance, unit $=\mathrm{m}$-ohm, 0.001 ohm ), it is forbidden to revert to Mfr's value by F160.
* F870-F873 are motor parameters of PMSM, they are not shown in the motor nameplate. User can get them by auto tuning or asking manufacture.

| F874 Position identification times | Setting range: $5 \sim 50$ | Mfr's value: 30 |
| :--- | :--- | :--- |
| F875 Position identification angle compensation | Setting range: $0 \sim 1000$ | Mfr's value: 0 |

-F875 is used to get correct rotor position.

| F876 PMSM injection current without load (\%) | Setting range: $0.0 \sim 100.0$ | Mfr's value: 10.0 |
| :--- | :--- | :--- |
| F877 PMSM injection current compensation <br> without load (\%) | Setting range: $0.0 \sim 50.0$ | Mfr's value: 20.0 |
| F878 PMSM cut-off point of injection current <br> compensation without load (\%) | Setting range: $0.0 \sim 50.0$ | Mfr's value: 10.0 |
| F879 PMSM injection current with heavy load (\%) | Setting range: $0.0 \sim 100.0$ | Mfr's value: 0.0 |

F876, F877 and F879 are the percent of rated current. F878 is the percent of rated frequency.
For example:
When $\mathrm{F} 876=20$, if $\mathrm{F} 877=10$ and $\mathrm{F} 878=0$, the injection current without load is $20 \%$ of rated current.
When $\mathrm{F} 876=20$, if $\mathrm{F} 877=10$ and $\mathrm{F} 878=10$, and rated frequency is 50 Hz , injection current without load will decrease by a linear trend from 30 ( $\mathrm{F} 876+\mathrm{F} 877$ ). When inverter runs to $5 \mathrm{~Hz}(5 \mathrm{~Hz}=$ rated frequency X $\mathrm{F} 878 \%$ ), injection current will decrease to 20 , and 5 Hz is cut-off point of injection current compensation without load.

| F880 | PMSM PCE detection time (S) | Setting range: $0.0 \sim 10.0$ | Mfr's value: 0.2 |
| :--- | :--- | :--- | :--- |

### 6.10. Communication Parameter

| F900 Communication Address | Setting range: <br> 1~255: single inverter address <br> 0: broadcast address | Mfr's value: 1 |
| :--- | :--- | :--- |
| F901 Communication Mode | Setting range: $1:$ ASCII 2: RTU <br> 3: Remote keypad | Mfr's value: 2 |
| F902 Stop bits | Setting range: 1~2 | Mfr's value: 2 |
| F903 Parity Check | Setting range: <br> 0: Invalid 1: Odd 2: Even | Mfr's value: 0 |
| F904 Baud Rate | Setting range: <br> $0: 1200 ; 1: 2400 ; ~ 2: ~ 4800 ; ~$ <br> 3: 9600; 4: 19200 5: 38400 6: 57600 | Mfr's value: 3 |
| F905 Communication timeout period (S) | Setting range: 0.0~3000.0 | Mfr's value: 0.0 |
| F907 Time 2 of communication timeout (S) | Setting range: 0.0~3000.0 | Mfr's value: 0.0 |

F904 $=9600$ is recommended for baud rate, which makes run steady. Communication parameters refer to Appendix 4.
When F905 is set to 0.0 , the function is invalid. When $\mathrm{F} 905 \neq 0.0$, if the inverter has not received effective command from PC/PLC during the time set by F905, inverter will trip into CE.
When F907>0, and receiving the previous data, if after the time set by F907, the next data is not received, inverter will output communication timeout signal. The timeout signal will be cleared by this terminal, and after receiving correct data, inverter will accumulate time again.

| F911 Point-point communication <br> selection | Setting range: <br> $0:$ Disabled 1:Enabled | Mfr's value:0 |
| :--- | :--- | :--- |
| F912 Master and slave selection | Setting range: <br> $0:$ Master 1:Slave | Mfr's value: 0 |

-F911 is sued to decide whether to enable point-point communication.
-F912 is used to decide whether inverter is master or slave.

| F913 Running command of slave | Setting range: <br> 0:Slave not following running <br> commands of master <br> 1:Slave following running commands <br> of master | Mfr's value: 1 |
| :--- | :--- | :--- |

-When F913 $=1$, the slave follows the master to start or stop. Except emergency stop command, please do not send stop command to slave. If slave stops by keypad, slave will trip into ESP.

| F914 Fault information of slave | Setting range: <br> Ones: slave fault information <br> 0 : Not sending fault information <br> 1 : Sending fault information <br> Tens: master's reaction when it loses <br> slave's response <br> 0 : No reaction 1: Alarm | Mfr's value: 01 |
| :---: | :---: | :---: |
| F915 Master action when salve failed | Setting range: <br> 0 : continue running <br> 1: free stop <br> 2: Deceleration to stop | Mfr's value: 1 |

-F914 ones: it is used to decide whether to send slave fault information to master.
Tens: when master loses slave's response (must be on-line status), master will trip into Er44.
-When F915=1 or 2, after inverter stops, remove the running command between master and slave, after
troubleshooting of slave, master can restart again.

| F916 <br> stops | Slave action when master | Setting range: <br> 1: Free stop 2: Deceleration to stop |
| :--- | :--- | :--- | Mfr's value: 10.

-When F913=1, F916 is valid.
-When F916 $=1$, slave will free stop.
When F916 $=2$, slave will stop according to deceleration time.

|  |  | Setting range: |
| :--- | :--- | :--- |
| F917 Slave following master | 0: given torque(torque) | Mfr's value: 0 |
| command selection |  | 1: given frequency 1(Droop) |
|  | 2: given frequency 2 (Droop) |  |

-The information type selection of master and slave must be same.
-When F917 $=0$, it is suitable for rigid connection occasion. Master must run in vector control mode, slave must run at torque control, and the limit speed of slave must be set correctly.
When F917 = 1 and 2, it is suitable for flexible connection occasion. Master and slave will work at speed mode and droop control function is valid. When $\mathrm{F} 917=1$, the target frequency is master given frequency. When F917=2, master given frequency is present frequency (only valid in VVVF control).

| F918 | Zero offset of received data (torque) | Setting range: $0.00 \sim 200.00$ | Mfr's value: 100.00 |
| :--- | :--- | :--- | :--- |
| F919 | Gain of received data(torque) | Setting range: $0.00 \sim 10.00$ | Mfr's value: 1.000 |

-F918 and F919 are used to adjust torque received from the master. The adjustment formula is as below:
$\mathrm{y}=\mathrm{F} 919$ * x + F918-100.00.
-When F918 $=100.00$, it means no zero bias.

| F920 Zero offset of received data <br> (frequency) | Setting range:0.00~200.00 | Mfr's value:100.00 |
| :--- | :--- | :--- |
| F921 Gain of received data(frequency) | Setting range:0.00~10.00 | Mfr's value: 1.00 |

F920 and F921 are used to adjust frequency received from the master. The adjustment formula is as below: y=F921 * x + F920-100.00
When $\mathrm{F} 920=100.00$, it means no zero bias.

| F922 window | Setting range: $0.00 \sim 10.00$ | Mfr's value: 0.50 |
| :--- | :--- | :--- |

When F917=0, F922 is valid. It is used to limit the slave speed in torque control mode.

| F923 Droop control | Setting range: 0.0 ( Invalid) $0.1 \sim 30.0$ | Mfr's value: 0.0 |
| :--- | :--- | :--- |

-When F917 $=1$ and 2, droop control is valid when master and slave are both in speed control mode.
Droop control allows tiny speed deviation between master and slave, reasonable droop rate setting needs to be adjusted according to actual situation.
Droop speed $=$ synchronizing frequency *output torque * droop rate
inverter actual output frequency $=$ synchronizing frequency - droop speed
$\cdot$ For example, when $\mathrm{F} 923=7 \%$, synchronizing frequency is 45 Hz , output torque is $35 \%$, Then inverter actual output frequency $=45-(45 * 0.35 * 0.07)=43.90 \mathrm{~Hz}$ 。

| F924 Time of communication timeout (S) | Setting range: $0.0 \sim 3000.0$ | Mfr's value: 0.0 |
| :--- | :--- | :--- |

- when F924 $=0.0$, inverter does not test the timeout.

| F925 Master sending data interval (S) | Setting range: $0.000 \sim 1.000$ | Mfr's value: 0.0 |  |  |
| :--- | :--- | :--- | :---: | :---: |
| F926 CAN baud rate (kbps) | Setting range: |  |  |  |
|  | $0: 20$ | $1: 50$ |  |  |
|  | $4: 100$ | $3: 125$ |  |  |
| Mfr's value: 6 |  |  |  |  |

Please refer to Appendix 8 for master/slave control operation.

| F928 | BACnet address | Setting range: $0 \sim 127$ | Mfr's value: 1 |
| :--- | :--- | :--- | :--- |
| F929 | BACnet baud rate (bps) | Setting range: | Mfr's value: 1 |

| F934 Master/slave adjustment time <br> benchmark (S) | Setting range: $0.0 \sim 10.0$ | Mfr's value: 0.5 |
| :--- | :--- | :--- |
| F935 Master/slave adjustment current <br> error (\%) | Setting range: $0.0 \sim 50.0$ | Mfr's value: 5.0 |
| F936 Adjustment mode of accel/decel | Setting range: <br> $0:$ mode 0 1: mode 1 | Mfr's value: 0 |

-This function is only valid during the accel/decel process of master/slave control mode. -F934 is the max adjustment accel/decel time when slave is running in the accel/decel process.
-If the percentage of output current and rated current is higher than F935, salve will adjust accel/decel time. -F936 is adjustment mode of accel/decel.
-F936=0 is mode 0 , it is adjusted according to master/slave output torque.
-F936=1 is mode 1, it is adjusted according to master/slave output current.

| F937 Slave adjustment frequency mode | Setting range: <br> 0: no adjustment <br> 1: Current balance adjustment <br> 2: current PID adjustment | Mfr's value: 1 |
| :---: | :---: | :---: |
| F938 Slave adjustment max frequency ( Hz ) | Setting range: $0.00 \sim 5.00$ | Mfr's value: 0.10 |
| F939 Slave adjustment frequency period (S) | Setting range: $0.00 \sim 10.00$ | Mfr's value: 0.50 |

-F937 is slave adjustment frequency mode.
-F937=0, this function is invalid.
$\cdot \mathrm{F} 937=1$, slave current is adjusted according to current balance of master/slave.
-When current balance of slave and master is higher than F935, slave will decrease frequency automatically, adjustment period is adjusted by F939.
-When current balance of slave and master is lower than F935, slave frequency remains constant.
-When current balance of master and slave is higher than F935, slave will increase frequency, to make sure the current balance within the range of F935.
$\cdot$ F937 $=2$, slave output frequency is adjusted by PID to make sure the current balance within the range of F935.
-F938 is slave adjustment max frequency.
-F939 is slave adjustment frequency period. The bigger the value is, the slower the frequency changes.
Note:

1) When $\mathrm{F} 937=1$ or 2, F936 is used to select current adjustment or torque adjustment.
2) When F936=1, slave and master should not have electricity generation, inverter can trip into over voltage easily.
3) Max frequency(F111) must be higher than target frequency 1.00 Hz

### 6.11 PID Parameters

### 6.11.1 Internal PID adjusting and constant pressure water supply

Internal PID adjusting control is used for single pump or double pump automatic constant-pressure water supply, or used for simple close-loop system with convenient operation.
The usage of pressure meter:
As FAO2=1: channel AI1
" 10 V " connect with the power supply of pressure meter, if the power supply of pressure meter is 5 V , please supply a 5 V power.
"AIl" connect with the pressure signal port of pressure meter
"GND" connect with the grounding of pressure meter
As FAO2=2: channel AI2
" 10 V " connect with the power supply of pressure meter, if the power supply of pressure meter is 5 V , please supply a 5 V power.
"AI2" connect with the pressure signal port of pressure meter
"GND" connect with the grounding of pressure meter
For current type sensor, two-line $4-20 \mathrm{~mA}$ signal is inputted to inverter, please connect CM to GND, and 24 V is connected to power supply of sensor.

### 6.11.2 Parameters

| FA00 Water supply mode | Setting range: <br> 0: Single pump (PID control mode) <br> 1: Fixed mode <br> 2: Timing interchanging | Mfr's value: 0 |
| :--- | :--- | :--- |

When FA $00=0$ and single pump mode is selected, the inverter only controls one pump. The control mode can be used in the closed-loop control system, for example, pressure, flow.
When $\mathrm{FA} 00=1$, one motor is connected with converter pump or general pump all the time.
When $F A 00=2$, two pumps are interchanging to connect with inverter for a fixed period of time, this function should be selected. The duration time is set by FA25.

| FA01 PID adjusting target given source | Setting range: | Mfr's value: 0 |
| :--- | :--- | :--- |
|  | 0: FA04 1: AI1 2: AI2 |  |
|  | 3: AI3 (Potentiometer on the keypad) |  |
|  | 4: FI (pulse frequency input) |  |

When FA01 $=0$, PID adjusting target is given by FA04 or MODBUS.
When FA01=1, PID adjusting target is given by external analog AI1.
When FA01=2, PID adjusting target is given by external analog AI2.
When FA01=3, PID adjusting target is given by the AI3 potentiometer on the keypad.
When FA01=4, PID adjusting target is given by FI pulse frequency (DI1 terminal).

| FA02 PID adjusting feedback given source | Setting range: | Mfr's value: 1 |
| :--- | :--- | :--- |
|  | 1: AI1 2: AI2 |  |
|  | 3: FI (pulse frequency input) |  |
|  | 4: reserved |  |
|  | 5:Running current |  |
|  | 6: Output power |  |
|  | 7: Output torque |  |

When FA02 $=1$, PID feedback signal is given by external analog AI1.
When FA02 $=2$, PID feedback signal is given by external analog AI2.
When FA02=3, PID feedback signal is given by FI pulse frequency input.
When FA02 $=5$, PID feedback signal is given by inverter running current.
When FA02=6,PID feedback signal is given by output power.

When FA02=7, PID feedback signal is given by output torque.

| FA03 Max limit of PID adjusting (\%) | FA04~100.0 | Mfr's value: 100.0 |
| :--- | :--- | :--- |
| FA04 Digital setting value of PID adjusting (\%) | FA05~FA03 | Mfr's value: 50.0 |
| FA05 Min limit of PID adjusting (\%) | $0.0 \sim$ FA04 | Mfr's value: 0.0 |

When negative feedback adjusting is valid, if pressure is higher than max limit of PID adjusting, pressure protection will occur. If inverter is running, it will free stop, and " nP " is displayed. When positive feedback adjusting is valid, if pressure is higher than Max limit, it indicates that feedback pressure is too low, inverter should accelerate or a linefrequency should be added to increase the displacement.
When FA01=0, the value set by FA04 is digital setting reference value of PID adjusting.
When positive feedback adjusting is valid, if pressure is higher than min limit of PID adjusting, pressure protection will occur. If inverter is running, it will free stop, and " nP " is displayed. When negative feedback adjusting, if pressure is higher than min limit, it indicates that feedback pressure is too low, inverter should accelerate or a linefrequency should be added to increase the displacement.
For example: if the range of pressure meter is $0-1.6 \mathrm{MPa}$, then setting pressure is $1.6 * 70 \%=1.12 \mathrm{MPa}$, and the max limit pressure is $1.6 * 90 \%=1.44 \mathrm{MPa}$, and the min limit pressure is $1.6 * 5 \%=0.08 \mathrm{MPa}$.

| FA06 | PID polarity | 0: Positive feedback <br> $1:$ Negative feedback |
| :--- | :--- | :--- | Mfr's value: 1 |  |
| :--- |

When FA06 $=0$, the higher feedback value is, the higher the motor speed is. This is positive feedback. When FA06=1, the lower the feedback value is, the higher the motor speed is. This is negative feedback.

| FA07 Dormancy function selection | Setting range: 0 : Valid 1: Invalid | Mfr's value: 1 |
| :--- | :--- | :--- |

When FA07=0, if inverter runs at the min frequency FA09 for a period time set by FA10, inverter will stop. When FA07=1, the dormancy function is invalid.

| FA09 Min frequency of PID adjusting (Hz) | Setting range: <br> $\operatorname{Max}(\mathrm{F} 112,0.1) \sim \mathrm{F} 111$ | Mfr's value: 5.00 |
| :--- | :--- | :--- |

The min frequency is set by FA09 when PID adjusting is valid.

| FA10 Dormancy delay time (S) | Setting range: $0.0 \sim 500.0$ | Mfr's value: 15.0 |
| :--- | :--- | :--- |

When FA07=0, inverter runs at min frequency FA09 for a period time set by FA10, inverter will free stop and enter into the dormancy status, "np" is displayed.

| FA11 Wake delay time (S) | Setting range: $0.0 \sim 3000$ | Mfr's value: 3.0 |
| :--- | :--- | :--- |

After the wake delay time, if the pressure is lower than min limit pressure (Negative feedback), inverter will begin running immediately, or else, inverter will be in the dormancy status.

| FA67 | Dormancy mode | Setting range: $0:$ dormancy mode 1 <br> 1: dormancy mode 2 | Mfr's value: 0 |
| :--- | :--- | :--- | :--- |
| FA68 | Given pressure offset $1(\%)$ | Setting range: $0.0 \sim 100.0$ | Mfr's value: 30.0 |
| FA69 | Given pressure offset $2(\%)$ | Setting range: $0.0 \sim 100.0$ | Mfr's value: 30.0 |

-When FA67 $=0$, inverter will be awaken according to FA03 and FA05.
If FA67=1 and FA06=1, when pressure is higher than target pressure, and PID adjusts to min frequency, inverter will enter into dormancy status after the setting time of FA10. If inverter is in the dormancy status and pressure is lower than target pressure-FA69, inverter will be awaken after wake delay time.
If FA06 $=0$, when pressure is lower than target pressure, and PID adjusts to min frequency, inverter will free stop and enter into dormancy status after the setting time of FA10. If inverter is in the dormancy status, when pressure is higher than target pressure + FA68, inverter will be awaken after weak delay time.

$$
\begin{array}{|l|l|l|}
\hline \text { FA12 PID max frequency }(\mathrm{Hz}) & \text { Setting range: FA09~F111 } & \text { Mfr's value: } 50.00 \\
\hline
\end{array}
$$

When PID is valid, FA12 is used to set the max frequency.

When FA18 $=0$ and FA01 $\neq 0$, PID adjusting target cannot be changed.

| FA19 | Proportion Gain P | Setting range: $0.00 \sim 10.00$ | Mfr's value: 0.30 |
| :--- | :--- | :--- | :--- |
| FA20 | Integration time I (S) | Setting range: $0.1 \sim 100.0$ | Mfr's value: 0.3 |
| FA21 | Differential time D (S) | Setting range: $0.0 \sim 10.0$ | Mfr's value: 0.0 |
| FA22 | PID sampling period (S) | Setting range: $1 \sim 500$ | Mfr's value: 5 |

Increasing proportion gain, decreasing integration time and increasing differential time can increase the dynamic response of PID closed-loop system. But if P is too high, I is too low or D is too high, system will not be steady.
PID adjusting period is set by FA22. It affects PID adjusting speed.
The following is PID adjusting arithmetic.

| FA23 PID negative frequency output selection | Setting range: <br>  <br>  <br>  <br> 0: Invalid 1: Valid <br> 2: only output negative frequency | Mfr's value: 0 |
| :--- | :--- | :--- |

When FA23=0, PID output frequency is FA09~FA12.
When FA23=1, PID output frequency is -FA12~FA12. The negative sign stands for reverse direction.
When FA23=2, PID output frequency is -FA12~0. The negative sign stands for reverse direction.

| FA24 Switching Timing unit setting | Setting range: $0:$ hour $1:$ minute | Mfr's value: 0 |
| :--- | :--- | :--- |
| FA25 Switching Timing Setting | $1 \sim 9999$ | Mfr's value: 100 |

Switching time is set by F525. The unit is set by F524.

|  | Setting Range |  |
| :--- | :--- | :--- |
| FA26 Under-load protection mode | 0: No protection |  |
|  | 1: Protection by contactor | Mfr's value: 0 |
|  | 2: Protection by PID |  |
|  | 3: Protection by current |  |
| FA27 Current threshold of under-load protection (\%) | Setting range: $10 \sim 150$ | Mfr's value: 50 |
| FA66 Duration time of under-load protection (S) | Setting range: $0 \sim 60.0$ | Mfr's value: 1.0 |

Note: the percent of under-load protection current corresponds to motor rated current.
Under-load protection is used to save energy. For some pumps device, when the output power is too low, the efficiency will get worse, so we suggest that the pumps should be closed.
During the running process, if the load decreases to zero suddenly, it means the mechanical part is broken. For example, belt is broken or water pump is dried up. Under-load protection must occur.
When FA26=1, water signal and lack water signal is controlled by two input terminals. When the lack water terminal is valid, inverter will enter into the protection status, and EP1 is displayed. When the water terminal is valid, inverter will deactivate EP1 fault automatically.

When FA26=2, PID adjusting frequency runs to max frequency, if inverter current is lower than the product FA27 and rated current, inverter will enter PID under-load protection status immediately, and EP2 is displayed.
When FA26=3, if inverter current is lower than the product of FA27 and rated current, after duration time of FA66, inverter will enter under-load protection, and EP3 is displayed.

| FA28 | Waking time after protection (min) | $1 \sim 3000$ | Mfr's value: 60 |
| :--- | :--- | :--- | :--- |

After the duration time of FA28, inverter will judge that whether the under-load protection signal disappears.
If malfunction is resetted, inverter will run again. Or else inverter will wait until malfunction is resetted. User can reset the inverter by pressing "stop/reset", inverter will stop.

| FA29 PID dead time (\%) | $0.0 \sim 10.0$ | Mfr's value: 2.0 |
| :--- | :--- | :--- |
| FA30 Running Interval of restarting converter pump (S) | $2.0 \sim 999.9$ | Mfr's value: 20.0 |
| FA31 Delay time of starting general pumps (S) | $0.1 \sim 999.9$ | Mfr's value: 30.0 |
| FA32 Delay time of stopping general pumps (S) | $0.1 \sim 999.9$ | Mfr's value: 30.0 |

FA29, PID dead time has two functions. First, setting dead time can restrain PID adjustor oscillation. The greater this value is, the lighter PID adjustor oscillation is. But if the value of FA29 is too high, PID adjusting precision will decrease. For example: when FA29 $=2.0 \%$ and $\mathrm{FA} 04=70$, PID adjusting will not invalid during the feedback value from 68 to 72 .
Second, FA29 is set to PID dead time when starting and stopping general pumps by PID adjusting. When negative feedback adjusting is valid, if feedback value is lower than value FA04-FA29 (which equal to set value MINUS dead-time value), inverter will delay the set time of FA31, and then start the general pump. If feedback value is higher than value FA04+FA29 (which equal to set value PLUS dead-time value), inverter will delay the set time of FA32, then stop the general pump.

- When starting general pump or interchange time is over, inverter will free stop. After starting general pump, inverter will delay the set time of FA30, and restart converter pump.
- When inverter drives two pumps and negative feedback adjusting, if the frequency already reach the max value and after the delay time (FA31), the pressure value is still lower than the value, then the inverter will stop output immediately and motor will freely stop. At the same time, the general pump will be started. After the general pump is fully run, if the present pressure is higher than the set value, inverter will low down the output to the min frequency. After delaying the set time (FA32), inverter will stop the general pump and start converter pump.
When inverter drives two pumps and positive feedback adjusting, if the frequency already reach the max value and after the delay time (FA31), the pressure value still higher than the value, then the inverter will stop output immediately and motor will freely stop. At the same time the general pump will be started. After the general pump runs, if the present pressure is lower than the set value, inverter will low down the output to the min frequency. After delaying the set time (FA32), inverter will stop the general pump and start converter pump.

| FA33 stop mode when constant pressure water <br> supply | 0 : free stop <br> $1:$ deceleration to stop | Mfr's value: 0 |
| :--- | :--- | :--- |

FA33 is used to set the stop mode after inverter stops converter pump or trips into nP and EP.

| FA36 Whether No. 1 relay is available | 0 : unavailable $\quad 1$ : available | Mfr's value: 0 |
| :--- | :--- | :--- | :--- |
| FA37 Whether No. 2 relay is available | 0 : unavailable $\quad 1$ : available | Mfr's value: 0 |

No 1 relay corresponds to the terminal DO1 in the control PCB, No 2 relay corresponds to the terminal TA/TC

| FA38 Proportion gain Kp2 | Setting range: $0.00 \sim 10.00$ | Mfr's value: 0.30 |
| :--- | :--- | :--- |
| FA39 Integration time Ki2(S) | Setting range: $0.1 \sim 100.0$ | Mfr's value: 0.3 |
| FA40 $\quad$ Differential time Kd2(S) | Setting range: $0.0 \sim 10.0$ | Mfr's value: 0.0 |

| FA41 | PI parameter switchover type | Setting range: 0: no switchover <br> 1: reserved 2: Auto switchover <br> 3: reserved | Mfr's value: 0 |
| :--- | :--- | :--- | :--- |
| FA42 | Switchover error 1 | Setting range: FA05~FA43 | Mfr's value: 0.0 |
| FA43 | Switchover error 2 | Setting range: FA42~FA03 | Mfr's value: 0.0 |

$\cdot$ FA $38 \sim$ FA40 is the second group of PID parameters. They can be used with the first group parameters separately.
-When FA41 $=0$, the first group PID parameters are used. The parameters are FA19~FA21.
-When FA41=2, if the current error(difference between PID given value and PID feedback) is higher than FA43, the second group of PID parameters will be used. When the current error is lower than FA42, the first group of PID parameters will be used. When current error is between error 1 and error 2, PID will use transition parameters.

| FA47 The sequence of starting No 1 relay | Setting range: $1 \sim 20$ | Mfr's value: 20 |
| :--- | :--- | :--- |
| FA48 The sequence of starting No 2 relay | Setting range: $1 \sim 20$ | Mfr's value: 20 |

The sequence of starting relays is set by FA47~FA48. The setting value of FA47 and FA48 must be different with each other, or else "Err5" is displayed in the keypad.

| FA58 Fire pressure given value (\%) | Setting range: $0.0 \sim 100.0$ | Mfr's value: 80.0 |
| :--- | :--- | :--- |

FA58 is also called second pressure, when the fire control terminal is valid, pressure target value will switch into second pressure value.

| FA59 Emergency fire mode | Setting range: <br> 0: Invalid 1:Emergency fire mode 1 <br> 2: Emergency fire mode 2 | Mfr's value: 0 |
| :--- | :--- | :--- |

When emergency fire mode is valid and emergency fire terminal is valid, inverter will be forbidden operating and protecting (When OC and OE protection occur, inverter will reset automatically and start running). And inverter will run at the frequency of FA60 or target frequency until inverter is broken.
Emergency fire mode 1: when the terminal is valid, inverter will run at target frequency.
Emergency fire mode 2: when the terminal is valid, inverter will run at the frequency of FA60.

| FA60 Running frequency of emergency fire | Setting range: F112~F111 | Mfr's value: 50 |
| :--- | :--- | :--- |

When the emergency fire mode 2 is valid and the fire terminal is valid, inverter will run at the frequency set by FA60.

| FA62 | when fire emergency control terminal is invalid | Setting range: $0 \sim 1$ |
| :--- | :--- | :--- | Mfr's value: $0 \quad$| ( |
| :--- |

-When FA62 $=0$, inverter keeps working at fire emergency mode
When FA62=1, inverter will quit from fire emergency mode.

| FA76 | Frequency range of under load(Hz) | Setting range: F112~F113 | Mfr's value: 5.00 |
| :--- | :--- | :--- | :--- |
|  |  | Setting range: |  |
| FA77 | running mode of under load | 0: invalid <br> 1: free stop <br> 2: stop by decelerating time | Mfr's value: 0 |
|  |  | 3: run at FA76 |  |

- FA77=0: The protection of under load is not enable.
- FA77=1: When the inverter runs normally, the output current is higher than under-load protection current. When the inverter is in the process of under load, the output current is lower than under-load protection current( motor's rated current *FA27), and keep longer time than FA66. Then, the inverter will free stop and displays Er55.
- FA77=2: When the inverter is in the process of under load, the output current is lower than under-load protection current( motor's rated current *FA27), and keep longer time than FA66. Then, the inverter will
stop by decelerating time and displays Er55.
- FA77=3: When the inverter is in the process of under load, the output current is lower than under-load protection current( motor's rated current *FA27), and keep longer time than FA66. Then, the inverter will run at FA76. If the load is recovered, the inverter will automatically run at the target frequency.

### 6.13 Torque control parameters

| FC00 <br> selection | Speed/torque control | 0: Speed control | 1: Torque control | 2: Terminal switchover | 0 |
| :--- | :--- | :--- | :--- | :--- | :--- |

0 : speed control. Inverter will run by setting frequency, and output torque will automatically match with the torque of load, and output torque is limited by max torque (set by manufacture.)

1: Torque control. Inverter will run by setting torque, and output speed will automatically match with the speed of load, and output speed is limited by max speed (set by FC23 and FC25). Please set the proper torque and speed limited.

2 : Terminal switchover. User can set DIX terminal as torque/speed switchover terminal to realize switchover between torque and speed. When the terminal is valid, torque control is valid. When the terminal is invalid, speed control is valid.

| FC02 | Torque accel/decel time (S) | $0.1 \sim 100.0$ | 1.0 |
| :---: | :--- | :--- | :---: |

The time is for inverter to run from $0 \%$ to $100 \%$ of rated torque.

|  |  | 0: Digital given (FC09) |  |
| :--- | :--- | :--- | :--- |
| FC06 | 1: Analog input AI1 |  |  |
|  | Torque given channel | 2: Analog input AI2 | 0 |
|  |  | 3: Analog input AI3 |  |
|  |  | 4: Pulse input channel FI |  |

When FC06=4, only DI1 terminal can be selected because only DI1 terminal has the pulse input function.

| FC07 | Torque given coefficient | $0 \sim 3.000$ | 3.000 |
| :--- | :--- | :--- | :--- |
| FC09 | Torque given command value (\%) | $0 \sim 300.0$ | 100.0 |

FC07: when input given torque reaches max value, FC 07 is the ratio of inverter output torque and motor rated torque. For example, if $\mathrm{FC} 06=1, \mathrm{~F} 402=10.00, \mathrm{FC} 07=3.00$, when AI1 channel output 10 V , the output torque of inverter is 3 times of motor rated torque.

|  |  | 0: Digital given (FC17) <br> 1: Analog input AI1 <br> 2: Analog input AI2 <br> 3: Analog input AI3 <br> FC14 <br> 4: Pulse input channel FI <br> 5: Reserved | 0 |
| :--- | :--- | :--- | :---: |
| FC15 | Offset torque given channel | Offset torque coefficient | $0 \sim 0.500$ |
| FC16 | Offset torque cut-off frequency (\%) | $0 \sim 100.0$ | 0.500 |
| FC17 | Offset torque command value (\%) | $0 \sim 50.0$ | 10.0 |

- Offset torque is used to output larger start torque which equals to setting torque and offset torque when motor drives big inertia load. When actual speed is lower than the setting frequency by FC16, offset torque is given by FC14. When actual speed is higher than the setting frequency by FC16, offset torque is 0 .
- When FC14 $\neq 0$, and offset torque reaches max value, FC15 is the ratio of offset torque and motor rated torque. For example: if $\mathrm{FC} 14=1, \mathrm{~F} 402=10.00$ and $\mathrm{FC} 15=0.500$, when AIl channel outputs 10 V , offset torque is $50 \%$ of motor rated torque.

| FC22 | Forward speed limited channel | 0: Digital given (FC23) <br> 1: Analog input AI1 <br> 2: Analog input AI2 <br> 3: Analog input AI3 <br> 4: Pulse input channel FI <br> 5: Reserved | 0 |
| :---: | :---: | :---: | :---: |
| FC23 | Forward speed limited (\%) | $0 \sim 100.0$ | 10.0 |

|  |  | 0：Digital given（FC25） |  |
| :---: | :--- | :--- | :---: |
| FC24 |  | 1：Analog input AI1 |  |
|  | Reverse speed limited channel | 2：Analog input AI2 | 0 |
|  |  | 3：Analog input AI3 |  |
|  |  | 4：Impulse input FI |  |
| FC25 | 5：Reserved | 10.0 |  |

－Speed limited FC23／FC25：if given speed reaches max value，they are used to set percent of inverter output frequency and max frequency F111．

| FC28 | Electric torque limit channel | 0：Digital given（FC30） <br> 1：Analog input AI1 <br> 2：Analog input AI2 <br> 3：Analog input AI3 <br> 4：Pulse input channel FI <br> 5：Reserved | 0 |
| :---: | :---: | :---: | :---: |
| FC29 | Electric torque limit coefficient | $0 \sim 3.000$ | 3.000 |
| FC30 | Electric torque limit（\％） | $0 \sim 300.0$ | 200.0 |
| FC33 | Braking torque limit channel | 0：Digital given（FC35） <br> 1：Analog input AI1 <br> 2：Analog input AI2 <br> 3：Analog input AI3 <br> 4：Pulse input channel FI <br> 5：Reserved | 0 |
| FC34 | Braking torque limit coefficient | $0 \sim 3.000$ | 3.000 |
| FC35 | Braking torque limit（\％） | $0 \sim 300.0$ | 200.00 |

－When motor is in the electric status，output torque limit channel is set by FC28．When FC28 does not equal to 0 ，limit torque is set by FC29．When $\mathrm{FC} 28=0$ ，limit torque is set by FC 30 ．
－When motor is in the Braking status，Braking torque limit channel is set by FC31．When FC33 does not equal to 0 ，limit torque is set by FC34．When $\mathrm{FC} 33=0$ ，limit torque is set by FC35．

| FC36 | Torque lower limit enabled | Setting range：0：Invalid 1：valid | Mfr＇s value： 0 |
| :--- | :--- | :--- | :--- |

| FC37 | Frequency at torque lower limit（Hz） | Setting range： $2.00 \sim 50.00$ | Mfr＇s value： 10.00 |
| :--- | :--- | :--- | :--- |
| FC40 | Lower limit torque threshold | Setting range： $0.0 \sim 20.0$ | Mfr＇s value： 3.0 |
| FC41 | Lower limit frequency threshold | Setting range： $1.00 \sim 10.00$ | Mfr＇s value： 1.00 |

－At torque mode，if frequency is lower than lower limit frequency，the frequency should be adjusted to lower limit frequency．
－When 当下限限制频率小于上限速度限定时，只能运行到上限速度限定。

| FC38 | Filtering time（ms） | Setting range： $0 \sim 5000$ |
| :--- | :--- | :--- | Mfr＇s value： 500

－当给定转矩增大或者负载转矩变小后，恢复加速时的延时时间。

| FC39 | Torque max value | Setting range： $0.0 \sim 300.0$ | Mfr＇s value： 250.0 |
| :--- | :--- | :--- | :--- |

| FC48 Torque switchover enabled | Setting range: <br> $0:$ Invalid $\quad$ : Valid | Mfr's value: 0 |
| :--- | :--- | :--- |
| FC49 Current-limiting point 2 (\%) | Setting range: F608~200 | Mfr's value: 160 |
| FC50 Frequency switchover point 1(Hz) | Setting range: $1.00 \sim$ FC51 | Mfr's value: 10.00 |
| FC51 Frequency switchover point 2(Hz) | Setting range: FC50~F111 | Mfr's value: 20.00 |

$\cdot \mathrm{FC} 48$ is used to limit max torque or max current during running process. In VF and auto torque promotion mode, it is used to limit current, in vector control mode. It is used to limit torque.
$\cdot \mathrm{FC} 49$ is the percentage of rated current in VF and auto torque promotion mode. FC49 is the percentage of rated torque in vector control mode.
FC50 and FC51 is frequency switchover point when torque or current change. Please see below Fig.

### 6.14 Parameters of the second motor

Please refer to Appendix 6 for the related function code, and please refer to F8 section for parameters explanations.

### 6.15 Parameters display

H000 Running frequency/target frequency $(\mathrm{Hz})$
In stopped status, target frequency is displayed. In running status, running frequency is displayed.

> H001 Actual speed/target speed (rpm)

In stopped status, actual speed is displayed. In running status, target speed is displayed.
H002 Output current (A)

In running status, output current is displayed. In stopped status, $\mathrm{H} 002=0$.
H003 Output voltage (V)
In running status, output voltage is displayed. In stopped status, $\mathrm{H} 003=0$.
$\square$
Bus voltage is displayed by H004.
H005 PID feedback (\%)
PID feedback value is displayed by H 005 .

| H006 Temperature $\left({ }^{\circ} \mathrm{C}\right)$ |  |  |
| :--- | :--- | :--- | :--- |

Inverter temperature is displayed by H 006.

| H007 Count value |  |  |
| :--- | :--- | :--- | :--- |

The count value of DI1 input impulse is displayed by H007.
H008 linear speed
Inverter linear speed is displayed by H 008 .

| H009 PID setting value (\%) |  |  |
| :--- | :--- | :--- |

PID setting value is displayed by H 009 .

| H010 | Yarn length |  |  |
| :--- | :--- | :--- | :--- |
| H011 central frequency $(\mathrm{Hz})$ |  |  |  |

Yarn length and central frequency are displayed by H 010 and H 011 .
H012 Output power (KW)
Inverter output power is displayed by H 012 .

| H013 | Output torque (\%) |  |  |
| :--- | :--- | :--- | :--- |
| H014 | Target torque (\%) |  |  |

Inverter output torque is displayed by H 013 and target torque is displayed by H 014.
H015 Encoder phase sequence adjustment
H015 is used to test whether the encoder direction is same with setting direction, please refer to F854.

## H016 Limit-voltage reference value

H016 is used to display limit-voltage reference value.
H017 Current stage speed for multi-stage speed
In multi-stage speed mode, current stage speed is displayed by H 017 .

Input pulse frequency of DI1 terminal is displayed by H018, the unit is 0.01

| H019 | Feedback speed (Hz) |  |  |
| :--- | :--- | :--- | :--- |
| H020 | Feedback speed (rpm) |  |  |

Feedback speed is displayed as frequency by H019. Feedback speed is displayed as speed by H020.

| H021 AI1 voltage (digital ) |  |  |
| :--- | :--- | :--- | :--- |
| H022 AI2 voltage (digital ) |  |  |
| H023 AI3 voltage (digital ) |  |  |

Analog input voltage is display by H021, H022 and H023.

| H025 | Current power-on time (minute) |  |  |
| :--- | :--- | :--- | :--- |
| H026 | Current running time (minute) |  |  |

Current power-on time and running time are displayed by H 025 and H 026.
H 027 Input pulse frequency $(\mathrm{Hz})$ $\square$
Input pulse frequency is displayed by H 027 , the unit is 1 Hz .

| H030 Main frequency source $\mathrm{X}(\mathrm{Hz})$ |  |  |
| :--- | :--- | :--- | :--- |

H031 Accessorial frequency source $\mathrm{Y}(\mathrm{Hz})$
Main frequency and accessorial frequency are displayed by H030 and H031.

| H033 Torque sent by master |  |  |
| :--- | :--- | :--- | :--- |
| H034 Frequency sent by master |  |  |
| H035 Quantity of slaves |  |  |

H033 is sued to display percentage of rated torque.
H034 is used to display the frequency sent by master.
H 035 is used to display the quantity of slaves.

| H036 Accumulative power-on time |  |  |
| :--- | :--- | :--- |
| H037 Accumulative running time |  |  |

## Appendix 1 Trouble Shooting

When malfunction occurs to inverter, don't run by resetting immediately. Check any causes and get it removed if there is any.
Take counter measures by referring to this manual in case of any malfunctions on inverter. Should it still be unsolved, contact the manufacturer. Never attempt any repairing without due authorization.
Table 1-1 Inverter's Common Cases of Malfunctions

| Fault | Description | Causes | Countermeasures |
| :---: | :---: | :---: | :---: |
| Err0 | Prohibition modify function code | * prohibition modify the function code during running process. | * Please modify the function code in stopped status. |
| Err1 | Wrong password | *Enter wrong password when password is valid <br> * Do not enter password when modifying function code. | * Please enter the correct password. |
| 2: O.C. | Over-current | * too short acceleration time <br> * short circuit at output side <br> * locked rotor with motor <br> * Too heavy load. <br> * parameter tuning is not correct. | *prolong acceleration time; <br> *whether motor cable is broken; <br> *check if motor overloads; <br> *reduce V/F compensation value <br> * measure parameter correctly. |
| 16: OC1 | Over-current 1 |  |  |
| 67: OC2 | Over-current 2 |  |  |
| 3: O.E. | DC Over-Voltage | *supply voltage too high; <br> *load inertia too big <br> *deceleration time too short; <br> *motor inertia rise again <br> * bad effect of dynamic braking <br> *parameter of rotary speed loop PID is set abnormally. | *check if rated voltage is input; <br> *add braking resistance(optional); <br> *increase deceleration time <br> * Enhancing the dynamic braking effect <br> *set the parameter of rotary speed loop PID correctly. <br> * Change to VF control for centrifugal fan. |
| 4: P.F1. | Input Phase loss | *phase loss with input power | *check if power input is normal; <br> *check if parameter setting is correct. |
| 5: O.L1 | Inverter Overload | * load too heavy | *reduce load; *check drive ratio; *increase inverter's capacity |
| 6: L.U. | Under-Voltage Protection | *input voltage on the low side | *check if supply voltage is normal <br> *check if parameter setting is correct. |
| 7: O.H. | Radiator Overheat | *environment temperature too high; <br> *radiator too dirty <br> *install place not good for ventilation; <br> *fan damaged <br> * Carrier wave frequency or compensation curve is too high. | *improve ventilation; <br> *clean air inlet and outlet and radiator; <br> *install as required; <br> *change fan <br> * Decrease carrier wave frequency or compensation curve. |
| 8: O.L2 | Motor Overload | * load too heavy | *reduce load; *check drive ratio; *increase motor's capacity |
| 11: ESP | External fault | *External emergency-stop terminal is valid. | *Check external fault. |
| 12: Err3 | Current malfunction before running | *Current alarm signal exists before running. | *check if control board is connected with power board well. <br> *ask for help from manufacture. |
| 13: Err2 | Parameters tuning wrong | * Do not connect motor when measuring parameters | *please connect motor correctly. |

| 15: Err4 | Current zero excursion malfunction | *Flat cable is loosened. <br> *Current detector is broken. | *check the flat cable. <br> *ask for help from manufacture. |
| :---: | :---: | :---: | :---: |
| 17: PF0 | Output <br> Phase loss | * Motor is broken <br> * Motor wire is loose. <br> * Inverter is broken | * check if wire of motor is loose. <br> * check if motor is broken. |
| 18: AErr | Line disconnected | * Analog signal line disconnected <br> * Signal source is broken. | * Change the signal line. <br> * Change the signal source. |
| $\begin{gathered} \text { 19: EP3 } \\ \hline 20: \\ \text { EP/EP2 } \\ \hline \end{gathered}$ | Inverter under-load | * Water pump dries up. <br> * Belt is broken. <br> * Equipment is broken. | * Supply water for pump <br> * Change the belt. <br> * Repair the equipment. |
| 22: nP | Pressure control | * Pressure is too high when negative feedback. <br> * Pressure is too low when positive feedback. <br> * Inverter enters into the dormancy status. | * Decrease the min frequency of PID. <br> * Reset inverter to normal status. |
| 23: Err5 | PID parameters are set wrong, | * PID parameters are set wrong. | * Set the parameters correctly. |
| 26: GP | Earth fault protection (T2 does not have GP protection) | *Motor cable is damaged, short connected to grounding. *Motor isolation is damaged, short connected to grounding. *inverter fault. | *change a new cable. <br> *repair the motor. <br> *contact manufacturer. |
| 27: PG | Encoder fault | *Encoder installation fault <br> *Encoder fault <br> *Encoder line number setting fault | *Check the installation and connection <br> *Check encoder <br> *Setting F851 correctly |
| 32: PCE | PMSM distuning fault | *motor parameters measurement is wrong. <br> *load is too heavy. | * Measure motor parameters correctly. <br> * Decrease the load. |
| 35: OH1 | PTC overheat protection | *external relay protection. | *check external heat protection equipment. |
| 44: Er44 | Master loses slave's response | *communication fault between master and slave | * check wiring. <br> *check baud rate <br> *check communication parameters setting |
| 45: CE | Communication timeout error | Communication fault | *PC/PLC does not send command at fixed time <br> *Check whether the communication line is connected reliably. |
| 47: EEEP | EEPROM read/write fault | *interference around <br> *EEPROM is damaged. | * remove interferences <br> *contact manufacturer. |
| 49: Err6 | Watchdog fault | *Watchdog timeout | *please check watchdog signal |
| 53: CE 1 | Keypad disconnection protection | *Keypad disconnection | *Check communication line |
| 55: Er55 | Off load protection | *external device is disconnected | *Check external device |

Table 1-2 Motor Malfunction and Counter Measures

| Malfunction | Items to Be Checked | Counter Measures |
| :--- | :--- | :--- |
| Motor not Running | Wiring correct? Setting correct? Too big with <br> load? Motor is damaged? Malfunction <br> protection occurs? | Get connected with power; Check <br> wiring; Checking malfunction; Reduce <br> load; Check against Table 1-1 |
| Wrong Direction of | U, V, W wiring correct? <br> Parameters setting correct? | To correct wiring <br> Setting the parameters correctly. |
| Motor Running Turning but <br> Speed Change not <br> Possible | Wiring correct for lines with given frequency? <br> Correct setting of running mode? <br> Too big with load? | To correct wiring; <br> To correct setting; Reduce load |
| Motor Speed Too <br> High or Too Low | Motor's rated value correct? Drive ratio <br> correct? Inverter parameters are set <br> in-corrected? Check if inverter output voltage <br> is abnormal? | Check motor nameplate data; Check <br> the setting of drive ratio; Check <br> parameters setting; Check V/F <br> Characteristic value |
| Motor Running <br> Unstable | Too big load? Too big with load change? <br> Phase loss? Motor malfunction. | Reduce load; reduce load change, <br> increase capacity; <br> Correct wiring. |
| Power Trip | Wiring current is too high? | Check input wring; Selecting <br> matching air switch; Reduce load; <br> checking inverter malfunction. |

## Appendix 2 Reference wiring of water system

## 1. Fixed mode of 1 inverter driving 2 pumps

## Instructions of wiring:

1. Please connect the wiring according to above wiring, after checking the wiring and close MCCB3.

2. Please set $\mathrm{F} 208=1$, $\mathrm{F} 203=9$, $\mathrm{FA} 00=1$, $\mathrm{FA} 36=1$, $\mathrm{FA} 37=1$, $\mathrm{FA} 47=1$, $\mathrm{FA} 48=2$, $\mathrm{FA} 04=$ pressure percentage, FA03=channel limit pressure, and FA05.
3. In manual status, please close power-frequency switch MCCB2. When pressing S1, pump M1 starts working. When pressing S2, M1 stops working. When pressing S3, M2 starts working. When pressing S4, M2 stops working.
4. In automatic status, please close converter-frequency switch MCCB1 and power-frequency switch MCCB2.

- When inverter is powered on, inverter will run forward by short-connecting DI3 terminal (or run reverse by short-connecting DI4 terminal), M1 will work at power frequency status.
- If the pressure is not high enough, inverter will accelerate to max frequency. If the pressure is still not high enough after duration time FA31, inverter will free stop and pump M2 will start working at power frequency status. After the duration time of FA30, inverter will start working and M1 works at converter frequency status.
- When two pumps work at the same time, if pressure is too high, inverter will decelerate to min frequency. If the pressure is still too high after the duration time FA32, M2 will stop working.
- If one pump M1 works at converter frequency status and inverter works at the min frequency, inverter
will free stop after the duration time FA10, inverter will enter into dormancy status and $n \mathrm{P}$ is displayed.

5. Rotating mode of 1 inverter driving 2 pumps

Instructions of wiring:

1. Please connect the wiring according to above wiring, after checking the wiring and close MCCB3.
2. Please set $\mathrm{F} 208=1$, $\mathrm{F} 203=9$, $\mathrm{FA} 00=2$, $\mathrm{FA} 36=1$, $\mathrm{FA} 37=1$, $\mathrm{FA} 47=1$, $\mathrm{FA} 48=2$, $\mathrm{FA} 04=$ pressure percentage, FA03=channel limit pressure, and FA05
3. In manual status, please close power-frequency switch MCCB2. When pressing S1, pump M1 starts working. When pressing S2, M1 stops working. When pressing S3, M2 starts working. When pressing S4, M2 stops working.
4. In automatic status, please close converter-frequency switch MCCB1 and power-frequency switch MCCB2.

- When inverter is powered on, KA1 is "action", and inverter will run forward by short-connecting DI3 terminal, KA2 makes M1 start working at converter frequency status. If the pressure is not high enough, inverter will accelerate to max frequency. If the pressure is still not high enough after duration time FA31, inverter will free stop and pump M2 will start working at power frequency status. After the duration time of FA30, inverter will start working and M1 works at converter
frequency status.
After the duration time FA25, all pumps will free stop, then KA2 is "action", M2 is converter pump. If the pressure is not high enough, inverter will accelerate to max frequency. If the pressure is still not high enough after duration time FA31, inverter will free stop and KA1 makes M1 start working at power frequency status. After the duration time of FA30, inverter will start working and M2 works at converter frequency status.
- When two pumps work at the same time, if pressure is too high, inverter will decelerate to min frequency. If the pressure is still too high after the duration time FA32, general pump will stop working.
If one pump works at converter frequency status and inverter works at the min frequency, inverter will free stop after the duration time FA10, inverter will enter into dormancy status and nP is displayed.

## Appendix 3 Products \& Structures

E2000 series inverter has its power range between $0.2 \sim 800 \mathrm{~kW}$. Refer to Tables 3-1 and 3-2 for main data. There may be two (or more than two) kinds of structures for certain products. Please make a clear indication when placing your order.

Inverter should operate under the rated output current, with overload permitted for a short time. However, it shall not exceed the allowable values at working time.

Table 3-1
Product List of E2000

| Model | Applicable <br> Motor (kW) | Rated Current Output | Structure Code | Cooling Mode | Remarks |
| :---: | :---: | :---: | :---: | :---: | :---: |
| E2000-0002S2 | 0.2 | 1.5 | E1 | Air-Cooling |  |
| E2000-0004S2 | 0.4 | 2.5 | E1 | Air-Cooling |  |
| E2000-0007S2 | 0.75 | 4.5 | E1 | Air- Cooling |  |
| E2000-0015S2 | 1.5 | 7.0 | E1 | Air- Cooling |  |
| E2000-0022S2 | 2.2 | 10.0 | E2 | Air-Cooling |  |
| E2000-0002T2 | 0.2 | 1.5 | E1 | Air- Cooling |  |
| E2000-0004T2 | 0.4 | 2.5 | E1 | Air- Cooling |  |
| E2000-0007T2 | 0.75 | 4.5 | E1 | Air-Cooling |  |
| E2000-0015T2 | 1.5 | 7 | E1 | Air- Cooling |  |
| E2000-0022T2 | 2.2 | 10 | E2 | Air- Cooling |  |
| E2000-0030T2 | 3.0 | 12 | E3 | Air-Cooling |  |
| E2000-0040T2 | 4.0 | 17 | E4 | Air- Cooling |  |

| E2000-0022T3 | 2.2 | 95 | 250W |  |
| E2000-0030T3 | 3.0 | 90 | 300W | $90 \Omega / 1.5 \mathrm{~kW}$ |
| E2000-0040T3 | 4.0 | 90 | 400W |  |
| E2000-0055T3 | 5.5 | 90 | 550W |  |
| E2000-0075T3 | 7.5 | 90 | 750W |  |
| E2000-0110T3 | 11 | 50 | 1.1 kW | $50 \Omega / 1.5 \mathrm{~kW}$ |
| E2000-0150T3 | 15 | 30 | 1.5 kW | $30 \Omega / 3 \mathrm{~kW}$ |
| E2000-0185T3 | 18.5 | 30 | 2.0 kW |  |
| E2000-0220T3 | 22 | 30 | 2.2 kW |  |
| E2000-0300T3 | 30 | 25 | 3.0 kW |  |
| E2000-0370T3 | 37 | 25 | 3.0 kW |  |
| E2000-0450T3 | 45 | 15 | 4.0kW | $15 \Omega / 4 \mathrm{~kW}$ |

| E2000-0550T3 | 55 | 15 | 4.0 kW | $15 \Omega / 4 \mathrm{~kW}$ |
| :---: | :---: | :---: | :---: | :---: |
| E2000-0750T3 | 75 | 12 | 6.0 kW | $12 \Omega / 6 \mathrm{~kW}$ |
| E2000-0900T3 | 90 | 8 | 9.0 kW | $8 \Omega / 9 \mathrm{~kW}$ |
| E2000-1100T3 | 110 | 8 | 9.0 kW |  |

Note: in the occasion of large inertia load, if the braking resistor heat is serious, please adopt the larger power of resistor than recommended resistor.

## Appendix 5 Communication Manual <br> (Version 1.8)

## I. General

Modbus is a serial and asynchronous communication protocol. Modbus protocol is a general language applied to PLC and other controlling units. This protocol has defined an information structure which can be identified and used by a controlling unit regardless of whatever network they are transmitted.

You can read reference books or ask for the details of MODBUS from manufactures.
Modbus protocol does not require a special interface while a typical physical interface is RS485.

## II. Modbus Protocol

### 2.1 Transmission mode

### 2.1.1 Format

1) ASCII mode

| Start | Address | Function | Data |  |  | LRC check |  | End |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $:$ | Inverter | Function | Data | Data | $\ldots$ | Data | High-order | Low-order | Return | Line Feed |
| $(0 X 3 A)$ | Address | Code | Length | 1 | $\ldots$ | N | byte of LRC | byte of <br> (0X0D) | $(0 \mathrm{X} 0 \mathrm{~A})$ |  |

2) RTU mode

| Start | Address | Function | Data | CRC check |  | End |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| T1-T2-T3-T4 | Inverter <br> Address | Function <br> Code | N data | Low-order byte <br> of CRC | High-order byte <br> of CRC | T1-T2-T3-T4 |

### 2.1.2 ASCII Mode

In ASCII mode, one Byte (hexadecimal format) is expressed by two ASCII characters.
For example, 31H (hexadecimal data) includes two ASCII characters' $3(33 \mathrm{H})^{\prime},{ }^{\prime} 1(31 \mathrm{H})$ '.
Common characters, ASCII characters are shown in the following table:

| Characters | ' 0 ' | '1, | '2' | '3' | '4, | '5' | '6' | ${ }^{7} 7$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ASCII Code | 30H | 31H | 32H | 33H | 34H | 35H | 36H | 37H |
| Characters | '8' | '9, | ' ${ }^{\text {' }}$ | 'B' | 'C' | 'D' | 'E' | 'F', |
| ASCII Code | 38H | 39H | 41H | 42H | 43H | 44H | 45H | 46H |

### 2.1.3 RTU Mode

In RTU mode, one Byte is expressed by hexadecimal format. For example, 31 H is delivered to data packet.

### 2.2 Baud rate

Setting range: 1200, 2400, 4800, 9600, 19200, 38400, 57600

### 2.3 Frame structure:

## ASCII mode

| Byte | Function |
| :---: | :--- |
| 1 | Start Bit (Low Level) |
| 7 | Data Bit |
| $0 / 1$ | Parity Check Bit (None for this bit in case of no checking. Otherwise 1 bit) |
| $1 / 2$ | Stop Bit (1 bit in case of checking, otherwise 2 bits) |

2) RTU mode

| Byte | Function |
| :---: | :--- |
| 1 | Start Bit (Low Level) |
| 8 | Data Bit |
| $0 / 1$ | Parity Check Bit (None for this bit in case of no checking. Otherwise 1 bit) |
| $1 / 2$ | Stop Bit (1 bit in case of checking, otherwise 2 bits) |

### 2.4 Error Check

### 2.4.1 ASCII mode

Longitudinal Redundancy Check (LRC): It is performed on the ASCII message field contents excluding the 'colon' character that begins the message, and excluding the CRLF pair at the end of the message.
The LRC is calculated by adding together successive 8 -bit bytes of the message, discarding any carries, and then two's complementing the result.
A procedure for generating an LRC is:

1. Add all bytes in the message, excluding the starting 'colon' and ending CRLF. Add them into an 8-bit field, so that carries will be discarded.
2. Subtract the final field value from FF hex (all 1's), to produce the ones-complement.
3. Add 1 to produce the twos-complement.

### 2.4.2 RTU Mode

Cyclical Redundancy Check (CRC): The CRC field is two bytes, containing a 16-bit binary value. The CRC is started by first preloading a 16 -bit register to all 1's. Then a process begins of applying successive 8-bit bytes of the message to the current contents of the register. Only the eight bits of data in each character are used for generating the CRC. Start and stop bits, and the parity bit, do not apply to the CRC.
A procedure for generating a CRC-16 is:

1. Load a 16-bit register with FFFF hex (all 1's). Call this the CRC register.
2. Exclusive OR the first 8 -bit byte of the message with the high-order byte of the 16-bit CRC register, putting the result in the CRC register.
3. Shift the CRC register one bit to the right (toward the LSB), zero-filling the MSB. Extract and examine the LSB.
4. (If the LSB was 0 ): Repeat Step 3 (another shift).
(If the LSB was 1): Exclusive OR the CRC register with the polynomial value A001 hex (1010 00000000 0001).
5. Repeat Steps 3 and 4 until 8 shifts have been performed. When this is done, a complete 8 -bit byte will have been processed.
When the CRC is appended to the message, the low-order byte is appended first, followed by the high-order byte.

### 2.4.3 Protocol Converter

It is easy to turn a RTU command into an ASCII command followed by the lists:

1) Use the LRC replacing the CRC.
2) Transform each byte in RTU command into a corresponding two byte ASCII. For example: transform $0 \times 03$ into $0 \times 30,0 \times 33$ (ASCII code for 0 and ASCII code for 3 ).
3) Add a 'colon' ( : ) character (ASCII 3A hex) at the beginning of the message.
4) End with a 'carriage return - line feed' (CRLF) pair (ASCII 0D and 0A hex).

So we will introduce RTU Mode in followed part. If you use ASCII mode, you can use the up lists to convert.

### 2.5 Command Type \& Format

### 2.5.1 The listing below shows the function codes.

| code | name | description |
| :---: | :--- | :--- |
| 03 | Read Holding Registers | Read the binary contents of holding registers in the slave. <br> (Less than 10 registers once time ) |
| 06 | Preset Single Register | Preset a value into holding register |

### 2.5.2 Address and meaning

The part introduces inverter running, inverter status and related parameters setting.
Description of rules of function codes parameters address:

1) Use the function code as parameter address

General Series:
High-order byte: 01~0A (hexadecimal)
Low-order byte: $00 \sim 50$ (max range) (hexadecimal) Function code range of each partition is not the same. The specific range refers to manual.
For example: parameter address of F114 is 010 E (hexadecimal).
parameter address of F201 is 0201 (hexadecimal).
For H section, please convert H 0 to 43.
For example: the address of H 014 is 430 E .
Note: in this situation, it allows to read six function codes and write only one function code. Some function codes can only be checked but cannot be modified; some function codes can neither be checked nor be modified; some function codes cannot be modified in run state; some function codes cannot be modified both in stop and run state.
In case parameters of all function codes are changed, the effective range, unit and related instructions shall refer to user manual of related series of inverters. Otherwise, unexpected results may occur.
2) Use different parameters as parameter address
(The above address and parameters descriptions are in hexadecimal format, for example, the decimal digit 4096 is represented by hexadecimal 1000).

## 1. Running status parameters

| Parameters Address | Parameter Description (read only) |
| :--- | :--- |
| 1000 | Output frequency |
| 1001 | Output voltage |
| 1002 | Output current |

| 1003 | Pole numbers/ control mode, high-order byte is pole numbers, low-order byte is control mode. |
| :---: | :---: |
| 1004 | Bus-line voltage |
| 1005 | Drive ratio/inverter status <br> High-order byte is drive ratio, low-order byte is inverter status Inverter status: <br> 0X00: Standby mode <br> 0X02: Reverse running <br> 0X05: DC over-current (OE) <br> 0X07: Frequency Over-load (OL1) <br> 0X09: Overheat (OH) <br> 0X0B: Interference (Err) <br> 0X0D: External Malfunction (ESP) 0X0E: Err3 0X0F: Err2 <br> 0X11: Err4 0X12: OC1 0X13:PF0 <br> 0X14: Analog disconnected protection (AErr) <br> 0X15: EP3 0X16: under-load (EP) 0X17: PP <br> 0X18: Pressure control protection (Np) <br> 0X19: PID parameters are set incorrectly (Err5) <br> $0 x 1$ A: Sleeping status (SLP) $0 \times 21$ : Motor overheat (OH4) <br> $0 \times 25$ : PTC overheat protection ( OH 1 ) <br> 0X2F: Communication timeout (CE) <br> 0X31: Watchdog fault (Err6) 0X34: oPEn fault <br> 0X36: STO 0X48: STO1 |
| 1006 | The percent of output torque |
| 1007 | Inverter radiator temperature |
| 1008 | PID given value |
| 1009 | PID feedback value |
| 100A | Read integer power value |
| 100B | DI terminal status: DI1~DI8-bit0~bit7 |
| 100C | Terminal output status : <br> bit0-OUT1 bit1-OUT2 bit2-fault relay |
| 100D | AI1: $0 \sim 4095$ read input analog digital value |
| 100 E | AI2: 0~4095 read input analog digital value |
| 100F | AI3: 0~4095 read input analog digital value |
| 1010 | Reserved |
| 1011 | $0 \sim 100.00 \%$ the percent of input pulse |
| 1012 | $0 \sim 100.00 \%$ the percent of output pulse |
| 1013 | Monitoring in which stage speed inverter is.  <br> $0000:$ no function $0001:$ stage speed 1 <br> $0010:$ stage speed 2 $0011:$ stage speed 3 <br> $0100:$ stage speed 4 $0101:$ stage speed 5 <br> $0110:$ stage speed 6 $0111:$ stage speed 7 <br> $1000:$ stage speed 8 $1001:$ stage speed 9 <br> $1010:$ stage speed 10 $1011:$ stage speed 11 <br> $1100:$ stage speed 12 $1101:$ stage speed 13 <br> 1110 : stage speed 14 $1111:$ stage speed 15 |

| 1014 | Monitoring external counting value |
| :--- | :--- |
| 1015 | Monitoring analog output percent, AO1 $\quad(0 \sim 100.00)$ |
| 1016 | Monitoring analog output percent, AO2 $\quad(0 \sim 100.00)$ |
| 1017 | Monitoring current speed. |
| 1018 | Read accurate power value, and correct the power to 1 decimal place. |
| 101 A | Output current(when the current is too high, data overflow from 1002) <br> 101A: high 16 bits of output current <br> 101B: low 16 bits of output current |
| 101 B | Transmission ratio |
| 101 C | Inverter is ready. |
| 101 D |  |

1. Control commands

| Parameters Address | Parameters Description (write only) |
| :---: | :---: |
| 2000 | Command meaning: <br> 0001: Forward running (no parameters) <br> 0002: Reverse running (no parameters) <br> 0003: Deceleration stop 0004: Free stop <br> 0005: Forward jogging start <br> 0006: Forward jogging stop <br> 0007: Reserved 0008: Run (no directions) 0009: Fault reset <br> 000A: Forward jogging stop 000B: Reverse jogging stop <br> 000C: Wakeup |
| 2001 | Lock parameters <br> 0001 : Relieve system locked (remote control locked) <br> 0002 : Lock remote control (any remote control commands are no valid before unlocking) <br> 0003: RAM and eeprom are permitted to be written. <br> 0004: Only RAM is permitted to be written, eeprom is prohibited being written. |
| 2002 | AO1 output percent is set by PC/PLC. <br> Setting range: 0~1000 <br> Token output analog is $0 \sim 100.0 \%$. |
| 2003 | AO 2 output percent is set by PC/PLC. <br> Setting range: 0~1000 <br> Token output analog is $0 \sim 100.0 \%$. |
| 2004 | FO output percent is set by PC/PLC. <br> Setting range: 0~1000 <br> FO token output pulse is $0 \sim 100.0 \%$. |
| 2005 | To control multi-function output terminal: 1 means token output is valid. 0 means token output is invalid. |
| 2006 |  |
| 2007 |  |
| 2009 | Voltage is set by PC/PLC when V/F separation. |

## 2. Illegal Response When Reading Parameters

| Command Description | Function | Data |
| :--- | :--- | :--- |
| Slave parameters response | The highest-order byte changes into 1. | Command meaning: |
|  |  | 0001 : Illegal function code |
|  |  | 0002 : Illegal address |
|  |  | 0003 : Illegal data |
|  |  | 0004 : Slave fault note 2 |

Note 2: Illegal response 0004 appears below two cases:

1. Do not reset inverter when inverter is in the malfunction state.
2. Do not unlock inverter when inverter is in the locked state.

### 2.5.3 Additional Remarks

## Expressions during communication process:

> Parameter Values of Frequency=actual value X 100 (General Series) Parameter Values of Frequency=actual value X 10 (Medium Frequency Series) Parameter Values of Time=actual value X 10 Parameter Values of Current=actual value X 10 Parameter Values of Voltage=actual value X 1 Parameter Values of Power=actual value X 100 Parameter Values of Drive Ratio=actual value X 100 Parameter Values of Version No. =actual value X 100

Instruction: Parameter value is the value sent in the data package. Actual value is the actual value of inverter. After PC/PLC receives the parameter value, it will divide the corresponding coefficient to get the actual value.
NOTE: Take no account of radix point of the data in the data package when PC/PLC transmits command to inverter. The valid value is range from 0 to 65535 .

## III Function Codes Related to Communication

| Function Code | Function Definition | Setting Rang | Mfr's Value |
| :---: | :---: | :---: | :---: |
| F200 | Source of start command | 0: Keypad command; <br> 1: Terminal command; <br> 2: Keypad + Terminal; <br> 3:MODBUS; <br> 4: Keypad+Terminal+MODBUS | 4 |
| F201 | Source of stop command | 0: Keypad command; <br> 1: Terminal command; <br> 2: Keypad + Terminal; <br> 3:MODBUS; <br> 4: Keypad+Terminal+MODBUS | 4 |
| F203 | Main frequency source X | 0: Digital setting memory; <br> 1: External analog AI1; <br> 2: External analog AI2; <br> 3: Pulse input given; <br> 4: Stage speed control; <br> 5: No memory by digital setting; <br> 6:Keypad potentiometer AI3; <br> 7: Reserved; <br> 8: Reserved; <br> 9: PID adjusting; 10: MODBUS | 0 |
| F900 | Inverter Address | 1~255 | 1 |

| F901 | Modbus Mode Selection | 1: ASCII mode <br> 2: RTU mode <br> 3: Remote keypad | 2 |
| :--- | :--- | :--- | :--- |
| F903 | Parity Check | 0: Invalid 1: Odd 2: Even | 0 |
| F904 | Baud Rate | 0: 1200 1: 2400 2: 4800 <br> 3:9600 4: 19200 5: 38400 6: 57600 | 3 |

Please set functions code related to communication consonant with the PLC/PC communication parameters, when inverter communicates with PLC/PC.

## IV Physical Interface

### 4.1 Interface instruction

Communication interface of RS485 is located on the most left of control terminals, marked underneath with $\mathrm{A}+$ and $\mathrm{B}-$

### 4.2 Structure of Field Bus

## Connecting Diagram of Field Bus

RS485 Half-duplex communication mode is adopted for E2000 series inverter. Daisy chain structure is adopted by 485 Bus-line. Do not use 'spur' lines or a star configuration. Reflect signals which are produced by spur lines or star configuration will interfere in 485 communications.
Please note that for the same time in half-duplex connection, only one inverter can have communication with PC/PLC. Should two or more than two inverters upload data at the same time, then bus competition will occur, which will not only lead to communication failure, but higher current to certain elements as well.

### 4.3. Grounding and Terminal

Terminal resistance of $120 \boldsymbol{\Omega}$ will be adopted for terminal of RS485 network, to diminish the reflection of signals. Terminal resistance shall not be used for intermediate network.

No direct grounding shall be allowed for any point of RS485 network. All the equipment in the network shall be well grounded via their own grounding terminal. Please note that grounding wires will not form closed loop in any case.

## Connecting Diagram of Terminal Resistance

Please think over the drive capacity of PC/PLC and the distance between PC/PLC and inverter when wiring. Add a repeaters if drive capacity is not enough.

All wiring connections for installation shall have to be made when the inverter is disconnected from power supply.

## V. Examples

Eg1: In RTU mode, change acc time (F114) to 10.0s in NO. 01 inverter.

## Query

| Address | Function | Register <br> Address Hi | Register <br> Address Lo | Preset <br> Data Hi | Preset <br> Data Lo | CRC Lo | CRC Hi |

| 01 | 06 | 01 | 0 E | 00 | 64 | E8 | 1 E |

Function code F114
Value: 10.0S

## Normal Response

| Address | Function | Register <br> Address Hi | Register <br> Address Lo | Response <br> Data Hi | Response <br> Data Lo | CRC Lo | CRC Hi |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 01 | 06 | 01 | 0 E | 00 | 64 | E 8 | 1 E |

Function code F114 Normal Response

## Abnormal Response

| Address | Function | Abnormal code | CRC Lo | CRC Hi |
| :---: | :---: | :---: | :---: | :---: |
| 01 | 86 | 04 | 43 | A3 |

## The max value of function code is $\mathbf{1 .}$ Slave fault

Eg 2: Read output frequency, output voltage, output current and current rotate speed from N0.2 inverter.

## Host Query

| Address | Function | First Register <br> Address Hi | First Register <br> Address Lo | Register <br> count Hi | Register <br> count L0 | CRC <br> Lo | CRC <br> Hi |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 02 | 03 | 10 | 00 | 00 | 04 | 40 | FA |

Communication Parameters Address $\mathbf{1 0 0 0 H}$
Slave Response：

|  |  | ${\underset{\sim}{\infty}}_{0}^{0}$ |  |  | $\begin{aligned} & \text { 霜 } \\ & \text { 坒 } \end{aligned}$ | $\begin{aligned} & \text { O } \\ & \text { ⿹ㅡN } \\ & \text { in } \end{aligned}$ |  | $\begin{aligned} & \text { o } \\ & \text { 或 } \end{aligned}$ |  | 䦉 0 | 0 0 0 0 | U |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 02 | 03 | 08 | 13 | 88 | 01 | 90 | 00 | 3C | 02 | 00 | 82 | F6 |
| Output Frequency |  |  |  |  | Output Voltage |  | Output Current |  | Numbers of Pole Pairs |  |  | Cont |

Mode
NO． 2 Inverter＇s output frequency is 50.00 Hz ，output voltage is 380 V ，output current is 0.6 A ，numbers of pole pairs are 2 and control mode keypad control．

Eg 3：NO． 1 Inverter runs forwardly．

## Host Query：

| Address | Function | Register <br> Hi | Register <br> Lo | Write <br> status Hi | Write <br> status Lo | CRC Lo | CRC Hi |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 01 | 06 | 20 | 00 | 00 | 01 | 43 | CA |

Communication parameters address 2000H Forward running
Slave Normal Response：

| Address | Function | Register <br> Hi | Register <br> Lo | Write <br> status Hi | Write <br> status Lo | CRC Lo | CRC Hi |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 01 | 06 | 20 | 00 | 00 | 01 | 43 | CA |

Normal Response
Slave Abnormal Response：

| Address | Function | Abnormal Code | CRC Lo | CRC Hi |
| :---: | :---: | :---: | :---: | :---: |
| 01 | 86 | 01 | 83 | A0 |

The max value of function code is 1 ．Illegal function code（assumption）
Eg4：Read the value of F113，F114 from NO． 2 inverter

## Host Query ：

| Address | Function | Register <br> Address Hi | Register <br> Address Lo | Register <br> Count Hi | Register <br> Count L0 | CRC <br> Lo | CRC <br> Hi |
| :---: | :---: | :--- | :---: | :---: | :---: | :---: | :---: |
| 02 | 03 | 01 | 0 D | 00 | 02 | 54 | 07 |

Communication Parameter Address F10DH Numbers of Read Registers
Slave Normal Response：

| Address | Function | Byte <br> count | The first <br> parameters <br> status Hi | The first <br> parameters <br> status Lo | The second <br> parameters <br> status Hi | The second <br> parameters <br> status Lo | CRC <br> Lo | CRC <br> Hi |

## III Dimension and installation

EPG01

For 5.5 KW and above 5.5 kW inverters, the expansion card is installed inside of inverter. The card is installed nearby control board, which is fastened by $3 * 5$ self-tapping screw. J4 connector is connected to J10 in the control board by 20-core flat cable.
For blow 4.0 kW inverters, PG card is installed outside of inverter, the cable should be shorter than 30 cm .

## IV Instruction

## 1. EPG01

### 1.1 Function

PG card must be selected when the drive is at the closed-loop vector control mode. PG card includes 2 orthogonal encoder signal process circuits, which can accept encoder signal of differential output, open-collector output, and push-pull output type. EPG01 is differential output PG card. The power of differential encoder is +5 V . Besides, PG card can deal with encoder signal for frequency-division output (output is 2 orthogonal signal). User can select it according to actual situation.

### 1.2 Terminal and DIP

| A | AN | B | BN | $5 V$ | CM | OUT-A | OUT-B |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

A, AN, B and BN are differential encoder signal input terminals. 5 V and GND are power and grounding of differential encoder. OUT-A, OUT-B + are frequency-division signal output terminals.

The frequency-division coefficient is set by DIP switch on the PG card. DIP switch has 5-digit, binary numbers stand for coefficient. DIP 1 stands for low byte of binary, DIP 5 stands for high byte of binary. When the switch is turned to ON, it means " 1 " or else, it means " 0 ".

## Please refer to below table:

|  | Binary | Frequency-division coefficient |
| :---: | :---: | :---: |
| 0 | 00000 | 1 |
| 1 | 00001 | 2 |
| 2 | 00010 | 4 |
| $\ldots$ | $\ldots$ | $\ldots$ |
| N | $\ldots$ | 2 N |
| 31 | 11111 | 62 |

### 1.3 Diagram

### 1.4 Frequency-division diagram

### 1.5 Caution

1. The signal wire of encoder should be far away from power wire.
2. Please select shielding wire as the encoder signal wire, and one end of it should be connected to grounding.
3. The given direction of inverter, the rotation direction of motor (from output axis of motor) and the rotation direction of encoder should be the same.

### 1.6 Connection

Differential output encoder ( $\mathrm{VCC}=5 \mathrm{~V}$, please indicate it when differential encoder is selected).

## 2. EPG02

### 2.1 Function

PG card must be selected when the drive is at the closed-loop vector control mode. PG card includes 2 orthogonal encoder signal process circuits, which can accept encoder signal of differential output, open-collector output, and push-pull output type. EPG02 is non-differential output PG card. The power of differential encoder is +15 V . Besides, PG card can deal with encoder signal for frequency-division output (output is 2 orthogonal signal). User can select it according to actual situation.

### 2.2 Terminal and DIP

| +15 V | PGA | PGB | CM | OUT-A | OUT-B |
| :---: | :---: | :---: | :---: | :---: | :---: |

- OUT-A and OUT-B are frequency-division signal output terminals. PGA and PGB are non-differential encoder signal input terminals. +15 V and CM are power and grounding of non-differential encoder. -The frequency-division coefficient is set by DIP switch on the PG card. DIP switch has 5-digit, binary numbers stand for coefficient. DIP 1 stands for low byte of binary, DIP 5 stands for high byte of binary. When the switch is turned to ON, it means " 1 " or else, it means " 0 ".
Please refer to below table:

|  | Binary | Frequency-division coefficient |
| :---: | :---: | :---: |
| 0 | 00000 | 1 |
| 1 | 00001 | 2 |
| 2 | 00010 | 4 |
| $\ldots$ | $\ldots$ | $\ldots$ |
| N | $\ldots$ | 2 N |
| 31 | 11111 | 62 |

### 2.3 Diagram

### 2.4 Frequency-division diagram

### 2.5 Caution

1. The signal wire of encoder should be far away from power wire.
2. Please select shielding wire as the encoder signal wire, and one end of it should be connected to grounding.
3. The length of shielding wire should be shorter than 30 m , if user needs the wire longer than 30 m , please indicate it.
4. The given direction of inverter, the rotation direction of motor (from output axis of motor) and the rotation direction of encoder should be the same.

## II. Connection

### 3.1 Open-collector output encoder

### 3.2 Push-Pull output encoder

## Appendix 8 Master/slave control

## I. Overview

Master/slave control means several drives to control same system, which motor shafts are connected together with gear, chain, or conveyor. The load is averagely distributed among all drives. Master is controlled by external signal, master communicates with slaves by cables.
The link types between motors include rigid connection and flexible connection.
Rigid connection means motors are connected by gear, chain or nearer synchronous belt. The speed difference between master and slave is small, master control mode is speed control, slave control mode is torque control.
Flexible connection means motors are connected by conveyor, the speed of master and slave has a tiny difference, master control mode is speed control, and slave control mode is also speed control.

## II. signal connection

1. CAN communication is adopted.
2. CAN communication distance

| F926 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Baud rate (kbps) | $\mathbf{1 0 0 0}$ | $\mathbf{5 0 0}$ | $\mathbf{2 5 0}$ | $\mathbf{1 2 5}$ | $\mathbf{1 0 0}$ | $\mathbf{5 0}$ | $\mathbf{2 0}$ |
| Communication distance <br> (m) | $\mathbf{4 0}$ | $\mathbf{1 3 0}$ | $\mathbf{2 7 0}$ | $\mathbf{5 3 0}$ | $\mathbf{6 2 0}$ | $\mathbf{1 3 0 0}$ | $\mathbf{3 3 0 0}$ |

The distance is measured value in the experiment, it has some difference with actual communication distance. User should adjust the distance according to actual situation, and shielding cable is suggested to be used.
3. Control cables are connected to master, master is connected to slave by communication cable.

4. When the application is load sharing, motors with same pole pairs and same rated frequency should be selected.

## III. System debugging

Please make sure all cables are connected correctly. Set motor parameters, test control loop and motor running when inverter runs at low frequency in $\mathrm{V} / \mathrm{F}$ control mode.
Check motor running direction. Each motor should run separately in V/F control mode, all motor running directions should be same, if the running direction is different, please change any two phases of motor.
Before setting master/slave control mode, please study each motor parameters separately.

## IV. Parameters setting

1. Rigid connection

Master: speed mode

Note: user must set the parameters according to the table when the parameters' remarks are "must be".

## V. Remarks

1. If baud rate must be decreased because of equipment distance, the time interval of master sending command must be extended.
2. The rated frequency of master and slave must be same.
3. The control mode (F106) of master and slave must be same.
4. Direction of master and slave must be same.
5. When rigid connection and in torque control, if slave cannot start because of low torque, torque bias should be increased.
6. Transfer boards are needed when master communicates with several slaves, please contact with manufacture.

| L | 20 | 20 |
| M | 20 | 20 |
| O | 440 | 440 |
| U | 221 | 221 |
| W | 122 | 122 |
| X | 60 | 60 |
| Z | 25 | 25 |
|  | 6 | 6 |
|  | 15 | 15 |

Note:

1. E2000 series inverter without built-in filter satisfies the CE requirements only with an EMC filter installed on the power input side.
2. When frequency inverter model does not include R3, the customer should select above options. There is no external filter for 200 kw and above 200 kw AC drive; they can satisfies the $\mathbf{C E}$ requirements.

## Appendix 10 Bus communication

## I. EtherCAT

### 1.1 Introduction

EtherCAT is a real-time Industrial Ethernet technology with the feature of flexible topology and easy operation. The protocol is suitable for high-speed control field because of its fast communication speed and efficient transmission rate of available data. With the CoE protocol, EtherCAT provides the same communication mechanisms as in CANopen: object dictionary, PDO, SDO and even the network management is similar. This makes it possible to implement EtherCAT with minimal effort in devices that were previously outfitted with CANopen, and large portions of the CANopen Firmware are even reusable.

### 1.2 Installation and connection

Fig1 Ether-CAT card installation

Fig2 Ether-CAT card dimension
1.3 Hardware layout

Fig 3 EtherCAT bus card

### 1.4 Topology

Line, tree, or star-chain: EtherCAT supports almost all of topologies. EtherCAT makes a pure bus or line topology with hundreds of nodes possible without the limitations that normally arise from
cascading switches or hubs.
When wiring the system, the combination of lines with branches or drop lines is beneficial: the ports necessary to create branches are directly integrated in many I/O modules, so no additional switches or active infrastructure components are required.

Additional flexibility is given regarding the possible cable types. Inexpensive industrial Ethernet cable can be used between two nodes up to 100 m apart in 100BASE-TX mode.

Up to 65,535 devices can be connected to EtherCAT, so network expansion is virtually unlimited. As is usual with Ethernet, arbitrary changes between the physical layers are allowed.

1.5 LED indicator

| Led number | Color | Function |
| :--- | :--- | :--- |
| STA | Green | STATUS |
| POW | Green | Power_on |
| RUN | Green | FieldBus_Run |
| ERR | Red | FieldBus_Error |

1.6

| SW2-dip1 | ON | Download program |
| :--- | :--- | :--- |
|  | OFF | Running program |
| SW2-dip2 | ON | Connect with terminal resistance. |
|  | OFF | Disconnect with terminal resistance. |

## II. CANopen

2.1 CANopen is a high layer protocol which bases on CAN serial bus system and CAL(CAN application layer). The communication card is used to connect inverter to CAN network.
2.2 Installation

Fig 9-5 CANopen card installation

Fig 9-6 CANopen card dimension
2.3 DB15interface pins

-214.

Fig 9-7 interface pins

| Pins No. | Signal cable |
| :---: | :---: |
| 1,6 | GND |
| 2,7 | AA |
| 3,8 | BB |
| 4,9 | LL |
| 5,10 | 24 V |
| 11,12 | YY |
| 13 | M0_IN |
| 14,15 | RES_IN |

2.4 CAN -bus connection

### 2.5 Hardware layout

2.6 LED indicator

| Led number | Color | Function |
| :--- | :--- | :--- |
| STA | Green | STATUS |
| POW | Green | Power_on |
| RUN | Green | FieldBus_Run |
| ERR | Red | FieldBus_Error |
| RX | Green | CAN_RX |
| TX | Red | CAN_TX |

### 2.7 Switch code

| Switch code | Position | Instructions |
| :--- | :--- | :--- |
| SW1-dip1 | ON | Drives select 485 mode. |
|  | OFF | Drives select 422 mode. |
| SW1-dip2 | ON | Connect with terminal resistance. |
|  | OFF | Disconnect with terminal resistance. |
| SW2-dip1 | ON | Download program |
|  | OFF | Download succeeds. |
| SW2-dip2 | ON | Connect with terminal resistance of CAN network. |
|  | OFF | Disconnect with terminal resistance of CAN network. |

## III Profibus

### 3.1 Introduction

PROFIBUS is a vendor independent, open fieldbus standard for a wide range of applications in manufacturing, process and building automation. Vendor independence and openness are guaranteed by the PROFIBUS standard EN50170. With PROFIBUS, devices from different manufacturers can inter-communicate. Suitable interfaces exist for PLCs, which include the Siemens, Mitsubishi and Allen Bradley range.

PROFIBUS-DP (De-central Periphery) is described in DIN 19245 Part 3, and forms part of EN 50170 with P-Net and WorldFIP. However it is important to note that P-Net and WorldFIP are wholly incompatible with PROFIBUS, using different wiring and transmission technologies.

The PROFIBUS-DP network uses a high speed version of the RS485 standard, permitting baud rates of up to 12 Mb baud.

A maximum of 32 PROFIBUS-DP stations (nodes) may be contained within a single network segment. Use of RS485 repeaters allows a total of up to 126 stations.

PROFIBUS-DP is a multimaster, master-slave, token passing network. More detailed information, including a detailed guide to products available, may be obtained from the various world-wide PROFIBUS user organisations.

### 3.2 Installation and connection

Fig 9-11 connection between communication card and inverter

Fig 9-12 Communication card dimension

### 3.2 Pins definition

| Pins No. | Definition | Function |
| :--- | :--- | :--- |
| 1 | -- | $\mathrm{N} / \mathrm{C}$ |
| 2 | -- | $\mathrm{N} / \mathrm{C}$ |
| 3 | RX/TX-P | Receive/transmit data P (B-Line) |
| 4 | RTS | Connect to relay station |
| 5 | GND | Grounding of 5V power |
| 6 | 5 V | 5 V power |
| 7 | -- | N/C |
| 8 | RX/TX-N | Receive/transmit data N (A-Line) |
| 9 | -- | N/C |

### 3.4 Hardware layout

Fig 2-2 Communication card appearance and structure component

### 3.5 LED display

| LED status | POW | DP | COMM | ERR |
| :--- | :--- | :--- | :--- | :--- |
| ON | Power on | DP enters into <br> data interaction <br> state. | Communication <br> succeeds. | Slave address sets <br> wrongly or drive trips <br> into fault status. |
| 1 Hz <br> FLASH | - | - | - | The function code <br> parameter address of <br> card access inverter is <br> illegal. |
| 2Hz <br> FLASH | - | - | Communication card <br> is searching inverter. | The function code <br> parameter data of card |

|  |  |  |  | access inverter is <br> illegal. |
| :--- | :--- | :--- | :--- | :--- |
| OFF | Power <br> failure | DP does not <br> enter into data <br> interaction <br> state. | - | The access is correct. |

Note: 1. 1-phase $0.4 \sim 0.75 \mathrm{kw}$ drives do not support Ethercat, Profibus and CANopen communication.
3. please refer to user manual of bus communication or Contact with manufacture.

## IV BACnet

The related parameters are as below:

| Parameter | Function description | Setting value | Mfr's value |
| :---: | :--- | :---: | :---: |
| F928 | BACnet address | $0 \sim 127$ | 1 |
| F929 | BACnet baud rate(bps) | $0: 9600$ $1: 19200$ <br> $2: 38400 \quad 3: 76800$  | 1 |
| F933 | BACnet device number | $0 \sim 65535$ | 1 |
